BULLETIN NR 13 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 7 1984 TO ALL RABIO AMATEURS

THE ARRL FILED TWO REQUESTS FOR RULEMAKING CONCERNING 160 METERS ON FEBRUARY 2. THE FIRST ASKS THAT POWER RESTRICTIONS ON 1900 TO 2000 KHZ BE ELIMINATED. THE SECOND REQUESTS THAT THE COMMISSION ALLOW F1 EMISSIONS ON 1800 TO 2000 KHZ. DETAILS WILL BE IN QST HAPPENINGS FOR APRIL.

ON MARCH 5, THE FCC DESIGNATED THE F1 REQUEST AS RM 4774. THE THIRTY DAY COMMENT DEADLINE ENDS APRIL 4. NO RULEMAKING NUMBER HAS BEEN ASSIGNED TO THE ELIMINATION OF POWER RESTRICTIONS PETITION YET.

BULLETIN NR 14 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 7 1984 TO ALL RADIO AMATEURS

FOLLOWS A MATTER OF PARTICULAR CONCERN TO RADIO AMATEURS IN MASSACHUSETTS. TO INSURE THE RETENTION OF THE COMMUNICATIONS TOWER ON MT. GREYLOCK, AMATEURS MAY WISH TO CONTACT THEIR MASSACHUSETTS STATE SENATORS AND REPRESENTATIVES IMMEDIATELY TO URGE PASSAGE OF MASSACHUSETTS SENATE BILL 1625. THE BILL IS NOW BEFORE THE JOINT HOUSE SENATE COMMITTEE ON STATE ADMINISTRATION. AMATEURS SHOULD MAKE THEIR VIEWS ON SENATE BILL 1625 KNOWN TO THEIR STATE SENATORS AND REPRESENTATIVES SUCH THAT THE BILL WILL RECEIVE FAVORABLE ACTION BY THE COMMITTEE.

BULLETIN NR 15 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 7 1984 TO ALL RADIO AMATEURS

WE MAY HEAR THE US XQ BEACON IN A FEW WEEKS. THE 145 MHZ BEACON IS ACTUALLY ON BUT IS VERY WEAK AND ONLY MOONBOUNCE RECEIVING EQUIPMENT CAN HEAR IT.

THE SATELLITE WILL BE COMMANDED FROM CALIFORNIA AS SOON AS A
COMMAND DECODER IS SHIPPED FROM ENGLAND. WE HAVE TWO THINGS IN
OUR FAVOR. FIRST, IT DOES NOT TAKE A LOT OF POWER TO COMMAND
THE SATELLITE AND SECOND, THE SATELLITE IS PROGRAMMED TO SHUT
OFF THE BEACONS IF IT HAS NOT BEEN COMMANDED IN 21 DAYS.

Subj: Martin,
Summary of data from Daryl VK1DK
Signals:-
Day 68 2259-2301
Intermittent raspy carrier on 145.822 with associated broad-
band RFI, 3 bursts of signals for 2-3secs on each occasion,
maximum level -120dBM
Day 69 0029-0036
Clean carrier
0029:31 0031:19
0031:40 0032:55 approx 145.806 -108dBM
0033:27 0034:07
0034:21 0034:44
0035:47 0035:55
0036:07 0036:16
Day 71 0018-0019
Clean carrier 145.827(6) -101dBM
0018:27 clean carrier appeared for 2-3secs on approx 145.823
0018-0019 spurious with intermittent line spectra and broad-
band (sawtooth shape) RFI on 145.82+/-0.25. Ragged carrier
with jagged sidebands (?telemetry) for about 3secs on 145.82

Angle data:-
Orroral valley coordinates -35.631 S 211.044 W

```
Day Time   Actual          Predicted
        AZ     EL      AZ     EL
68 2259:20 162.7 34.3     165    30
   2300:20 173.4 23.3     175    20
   2301:2: 199.0 15.4     181    13

71 0009:10 336.0  3.5     342     0
   0010:10 336.0  3.5     338     1
   0018:10 241.8 16.5     236    15
   0019:10 230.4 12.4     226    10
Predicted data form W3IWI program using NASA set with epoch
day 62.13.....etc

Doppler data:-
Day 68    2301     -3Khz  Landsat -3254 Uosat -2498
    71    0008:15  +2.6   Landsat >3200 Uosat >3000
    71    0018:27  -2     Landsat -2003 Uosat -1806
The doppler figures for Landsat and Uosat are predicted only
(i.e. Landsat by NASA  Uosat by W3IWI program)

Hope the above data maybe of some use. Is there any like-
lihood of you letting the Watch-Dog timer time out then
trying for a fresh start ???? Anyway everyone in VK has
everything crossed for you to successfully regain control
of Uosat-2
Cheers from 'Down-Under'
Graham VK5AGR

Following is a comparison of AOS times for KA9Q on 14 March 84 as
```

predicted by a couple of sets. I am highly suspicious of all sets between NASA #5 and MH 3-11-84mod, since #4 and MH 3-13-84 match so closely.

NASA #4: 01:08:23
NASA #5: 01:05:11
MH 3-7-84: 01:06:22
MH 3-11-84mod: 01:07:54
MH 3-13-84: 01:08:27

73, Phil

I may have spoken too soon on the subject of UO-11 element set accuracy. Recent reports from the Orroral Valley tracking station in Australia for days 68 and 71 do not correlate well at all with all of the recent element sets, but they are much closer to NASA sets #1 and 2.

Whatever object is being tracked in element sets #3, 4, 5, MH 3-7-84, MH 3-11-84, MH 3-11-84mod and MH 3-13-84 is running about 12-13 minutes earlier than what was tracked for sets #1 and 2. This confusion might very well be responsible for the unsuccessful NK6K/N6CA command attempts, and I'm trying to track this problem down.

Phil

Regarding the inquiry about signal generators:

The problem with RF generators is stability, dial accuracy, and output level calibration. All three are expensive. I am not familiar with the Heath RF generators, but I know of one of their solid state audio generators that drifts badly.

I picked up a used Boonton 202C. I usually see at least one at a hamfest in the $50 to $75 range. They originally were about #1500. They cover 50 to 220 Mhz, have the output calibrated in microvolts (50 ohms) and have both AM & FM modulation. To use on 2 meters or anything requiring precise frequency accuracy, I use a counter on it but after 15 minutes it is quite stable. There is a matching mixer unit that provides 100 Khz to 50 Mhz output.

The most cost effective RF generator is the old surplus BC-221 hetrodyne frequency meter. I always have mine on the bench. They can be had for as little as $10 (without the calibration book, which is not really needed if you have a counter). The Navy LM meter is practically the same. Dial accuracy and drift are excellent but the output is high impedance uncalibrated level. It covers 200 kHz to 20 MHz on fundamentals and higher on harmonics. Fair Radio usually handles these. You may have to come up with a power supply (6.3 volts and 150 volts dc regulated). There is a higher frequency version of this unit that goes from 20 MHz up, but I am not familiar with it.

Another good one is the Gertsch FM-3 type frequency meter. It is really a commercial version of the BC-221 and does not need a calibration chart but has direct dial readout. THey operate from 20 MHz up. Hetrodyne freq meters both generate and detect signals so they can be quite handy.

       The local oscillator of a programmable scanner, or using
     the
       output  of  a general coverage transmitter (TR7), have served
       as signal generator substitutes for me.

       These sources are usually more stable and tuneable than most
```

signal generators.

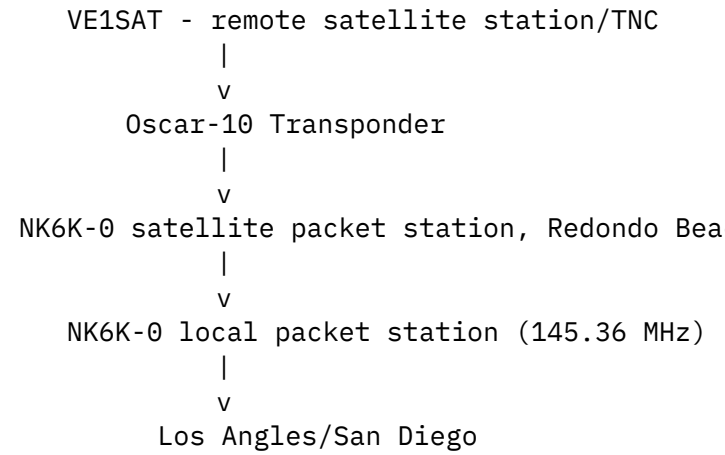
Subj: More on gateays
This morning, around 19:00 UTC, 14 MAR 84, Randy VE1SAT/VE6(VE1PAC) and
I did some more gateway experiments. Randy was able to remotely command a
local LA two meter TNC. I had two TAPR TNCs placed back to back on
their serial ports, with one TNC connected to the ao-10 gear, and the other
connected to a 2 meter handheld on 145.36MHz.

The oscar TNC was in transparent mode, the local TNC was just attached,
initially it was in command mode. The setup was



VE1SAT - remote satellite station/TNC
Oscar-10 Transponder
NK6K-0 satellite packet station, Redondo Beach
NK6K-0 local packet station (145.36 MHz)
Los Angles/San Diego

Once VE1SAT was connected to the serial input of a local LA TNC, he could

connect to anyone. The endpoint selected was WB6YMH-2, a TNC with a CPM ($50 820 board) system. Once connected to WB6YMH-2, Randy ran a version of the W3IWI orbit program.

The test ended when the temporary cable between TNCs fell apart, but it was enough to show the idea.

Harold.

Subj: UO-11 commanding
I wanted to mention the folks involved in the LA UO-11 command effort.

We have been attempting to command on the 1.2 GHz uplink, unfortunately without success. Phil Karn has been feeding us orbital predictions with frequencies corrected for doppler (there is a lot of doppler at 1.2GHz). Phil has some new data that shows that the element set he has been predicting from may have been off far enough that we wouldn't have stood a chance of getting in, even with our blast at the sky method. On some of the passes, we picked a spot in the sky through which the s/c should pass and didn't move the antenna array, assuming that even if we were wrong on the time, the s/c ground track should have been close.

We have been using the station of N6CA, Chip Angle. He's been running 160 watts into a 340 element array, for about 60kw eirp. Wally, WA6JPR and Skip, WB6YMH have provided other equipment and support. Henry Radio Inc., thru Jack, WA6VGS loaned us equipment, including an FM source for 27-30 MHz.

LA attempts will resume, after the element set problem is sorted out. We haven't given up hope.

Keep listening,

Harold, NK6K.

Subj: Re: UOB Elements
Roger, Neville,
John Browning, W6SP, has agreed to check a few contacts back at the USAF command center in Sunnyvale and see what he can find. Yesterday, after coming to the realization that the elements were suspect, I spent quite a bit of time on the phone trying to resolve the issue without much luck, probably because I don't know the right questions to ask. I'm sure John can help.

My primary contact for elements, the MIT Lincoln Labs Millstone Hill (MH) radar site in central Massachusetts, does only deep space tracking (period > 225 minutes) with their 1295 mhz radar. While I developed good contacts there when they helped us immeasurably after the AO-10 launch, they aren't much help for UO-B; all they can do is repeat other (i.e., NORAD) elements if they've come in on the teletype machine.

I also called "direct to the source", i.e., NORAD at Cheyenne Mountain in Colorado, and asked for recent elements; I got the same set I had previously gotten from MH. I then asked for all known objects associated with the same launch, and there were only three (Landsat, UoSAT, launcher). Of these, the launcher is clearly identifiable, since it is in a 500 x 700 elliptical orbit due to the post-separation depletion burns.

Here's some predicted AOS times for KA9Q from a collection of element sets. As I mentioned before, the big jump in time for UO-11 occurred between NASA sets #2 & #3, while Landsat predictions have changed less than 2 minutes in 9 days.

UO-11, set 2 (epoch on day 62): 00:24:58
UO-11, set 13 (epoch on day 73): 00:11:49

Landsat, set 5 (epoch on day 64): 00:24:03
Landsat, set MH 3-14-84 (epoch on day 73): 00:25:48.5

I don't know what they could be tracking as "UoSAT". Is there a possibility that the clamp band or other debris (a bolt cutter, say) broke off the launcher at separation? If they are tracking something associated with the launch, it would most likely be a lightweight object with relatively high drag/mass ratio to have moved ahead in time by so much.

FYI, here's the Landsat set I received yesterday. Until we get something more reliable for UO-11, maybe you're just as well off trying these?

In our ever continuing effort to show up the rest of the northern
hemisphere, here is the current list of active users in the LA/SD
area.  Of the 36 Bulletin Board users below, 23 have logged in at
least one in the past seven days.  The area now has 2 CPM host systems,
one gets most of the general stuff from this net and AMSAT TMAIL. Also
one mailbox system, and one experimental digital duplex repeater with
back to back 202 modems for bit regen.  We also have a oscar-10
teleport.  VE1SAT logged thru it to UUT yesterday and pulled 9k
bytes thru in about 15 minutes.  Enough TNCs are on the air to
ensure multiple digipeat paths linking Santa Barbara to San Diego and
most points in between.  Some users are so far out in the boonies that
they need a multi-digipeat hop to talk to anyone else.  N6DPU must go
WA4EJR->WA6OZJ->WB6UUT.  There are other examples.  Even a mountain
top repeater wouldn't help this guy.  I throw this in just to bug
the "protocol experts" and "purists".  Sure, multihopping looks ugly
in the header, and sure, it boggles the mind when thinking about efficiency.
But it enabled us on the west coast to get 50+ boards over 15,000 square
```

miles linked into a common knowledge and interest pool without spending $ on a multi-port link box or waiting for a level three protocol. And that's what ham radio is all about. Using what you've got to get the job done.

We'll move to level three PDQ when one is available, but until then we'll keep moving data. I guess this was all started by something I got in the mail about one of the newer packet board producers to hit the scene. The one that says something like "Our board is pure and good, and we didn't implelement any of the tack on warts, like multihopping." I had a neat line here, but it may have been considered libelous so I took it out, I'm basically a nice guy.

Anyway, here is the user list. Not everyone in the area is a BB user, and if you don't check in for three weeks or so, Lynn throws your ID out.

Subj: UOSAT-2 ORBIT DATA?
  ** UOSAT-2 RECOVERY MISSION **
  It has become now very urgent that we resolve the
uncertainty in the UOSAT-2 orbit data. I have just been
talking to the Canberra tracking station and it appears that
they will no be so involved with LANDSAT-5 from now on and
also the operator who has been following UOSAT-2 has changed
shift and so observations will be much less frequent. A more
detailed discussion of the observations they made on UO-2 does
seem to lend support to the theory that the 145 MHz beacon is
on and misbehaving in some way.
   I have negotiated with Jodrell Bank (UK) to have access to
thier antenna soon to listen for UO-2 but we MUST have
reliable orbit data to make this effort and those of Harold
Price et al worthwhile. I am sure that everyone realises how
essential this is but any ideas for help or means whereby we
can expedite these data would be invaluable.
   Thanks to all who are helping,
  Martin Sweeting UOSAT Programme Manager

Subj: UOB ELEMENT STATUS

The following report has been received by telephone from the Air Force Satellite Control Facility in Sunnyvale CA:

1. Close correlation of independent NASA (beacon) and NORAD (radar) tracking data confirms that Object 14780 is LANDSAT.

2. The inclination of object 14782 is more than a degree different from the similar inclinations of 14780 and 14781. This change resulted from the two burns performed on the upper stage after separation of the two spacecraft. Therefore 14782 must be the upper stage.

3. No objects, other than the three catalogued, have been observed. Nothing in the way of launcher parts which might have been ejected were large enough to be detected.

4. By a process of elimination, object 14781 must be UOB. The latest data available is set # 13 which corresponds to that provided by PKARN in his telemail posted to the AMSAT bulletin board at 2016Z on 13 March (Epoch 84073.70137990).

For lack of any other ideas on what to do next, I have requested that NORAD recognize our spacecraft emergency situation, and give priority to obtaining updated elements as often as possible.

Good luck!

Subj: UOB ELEMENT STATUS ADDENDUM

UOB priorty has been established. Our Sunnyvale contact will be visiting NORAD Monday and Tuesday. While there he will personally examine radar cross section information as well as the tracking data to verify the validity of UOB elements.

I'm moving in a couple of months and have some stuff
I've hung on to through two other moves. I guess I gotta
admit I don't need it so out it goes. If you're a confirmed
junk collector like me, or know some kid who wants the stuff to
tinker with (kids in their forties, like me, also eligible)
come and get it. Included are:

50 feet of 50 ohm hard coax (1/2 inch)

Working GE old tube type mobile receiver (low band) w/ PS
Working old GE 50 watt VHF base sta/repeater converted to 2meters
Old heath scope good only for showing what a distorted sine wave is
130 volt power supply good for a coupla amps
other misc. junk maybe good for parts.

The stuff is in Middletown NJ. Call me (or my wife) on 671-8558.
If not gone soon, trash collector gets it.

HELP!!! I'm working on an old National NCX-5 transceiver for a new ham.
He just picked it up at a local hamfest. It came with a partial manual, but
no schematic. Unfortunately, it had been "CBed" and someone had done a bit
of "work" on it. So far, I have found that the coils have been "diddle-sticked"
and a 100K resistor in the transmit driver cathode. I still can't get
sufficient drive and the receiver sensitivity should be better. Any help
will be appreciated. I understand that the NCX-3, a three band version,
might be similar. Please help me get this new ham on the air.

Help! I'm looking for anyone who got the RSGB MUF
program working on a TI99/4A. I've worked on it
for a few weeks and have found numerous typing errors
(on my part), but now think I have it input correctly.
But it still bombs at line 1490, where it tries to

raise a negative number to the -.4 power (only for
certain paths, fluxes, etc.). Sure wish I knew what
I'm doing wrong!

Any help would be greatly appreciated.

More gateway activity, this time on HF. Bob Bruninga, WB4APR, backed
two TNCs together, one pointed toward HF and the other toward the
AMRAD packet repeater. I connected with Bob on 10.147MHz LSB 200Hz
shift 300BPS last Sunday evening and had packet QSOs with Bill, WB4NFB,
of Burke, VA and Rod, WA3MEZ, of Randallstown, MD.

I plan on activating a similar arrangement here in the Des Moines area
this coming weekend. Hopefully we will have a gateway to gateway QSO
between stations connected via VHF links in our respective areas thru
the HF link.

CRRL BULLETIN NR 9   FROM CRRL HEADQUARTERS   LONDON ONT

MARCH 16 1984 TO ALL RADIO AMATEURS

DOC HAS GIVEN NOTICE THAT IT INTENDS TO AMEND THE RADIO OPERATORS CERTIFICATE REGULATIONS TO INCLUDE PUNCTUATION MARKS, Q SIGNALS AND EMERGENCY SIGNALS IN CODE RECEIVING TESTS, TO REVOKE REQUIREMENTS FOR ORAL AND PRACTICAL TESTS ON RADIO EQUIPMENT, AND THE REQUIREMENT TO DRAW SCHEMATIC DIAGRAMS ON WRITTEN TESTS. CRRL WILL RECOMMEND THAT DOC LIMIT PUNCTUATION MARKS AND Q SIGNALS TO THOSE IN COMMON USE.

DOC WILL HOLD AMATEUR EXAMS ACROSS CANADA ON APRIL 18. IF YOU PLAN TO WRITE, YOUR APPLICATION MUST BE SUBMITTED TO DOC BY MARCH 21. DOC EXAMS WILL ALSO BE HELD ON JUNE 20 AND OCTOBER 17.

BULLETIN NR 19 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 13 1984 TO ALL RADIO AMATEURS

NEWS FROM SURREY THIS WEEK REGARDING OSCAR 11 IS STILL MAINLY DISAPPOINTING. NO FURTHER COMMANDS HAVE BEEN ACCEPTED FROM THE GUILFORD COMMAND STATION AND COMMANDS FROM LOS ANGELES ON 1.2 GHZ HAVE ALSO BEEN UNSUCCESSFUL. AMSAT WOULD APPRECIATE OTHER WELL EQUIPPED STATIONS LISTENING TO THE OSCAR 11 DOWNLINK FOR POSSIBLE SIGNALS. SEND REPORTS TO THE UNIVERSITY OF SURREY VIA AMSAT OR ARRL.

ON SUNDAY MARCH 11, ON ORBIT 560 OF OSCAR 10, THE INTERCONNECTION OF TWO PACKET RADIO STATIONS WITH INTERMEDIATE LINKS USING A TERRESTRIAL PACKET REPEATER AND TWO OSCAR 10 GROUND STATIONS WAS SUCCESSFULLY DEMONSTRATED. STATIONS PARTICIPATING WERE W3IWI, KA6M, NK6K, AI8A/6 AND WA0OJS/6.

DX BULLETIN NR 11 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 16 1984 TO ALL RADIO AMATEURS

THANKS TO W1TRC, K1MM AND K1XM OF THE SOUTHERN NEW ENGLAND DX ASSOCIATION FOR THE FOLLOWING DX INFORMATION.

CLIPPERTON. THE FRENCH/AMERICAN GROUP SAILED LAST SUNDAY AND EXPECTS TO BEGIN OPERATIONS ON MARCH 15 OR 16. FOURTEEN OPERATORS WILL MAN SIX TRANSMITTERS FOR A SIX DAY OPERATION. THERE WILL BE A DIFFERENT CALL ON EACH BAND, FROM FO0XU ON 160 METERS TO FO0XZ ON 10 METERS.

KERMADEC. THE NEW ZEALAND GROUP PLANS TO BEGIN OPERATIONS TODAY FOR A TEN DAY STAY. FOUR OPERAZORS WITH FOUR TRANSMITTERS WILL OPERATE SSB AND CW ON 160 THROUGH 10 METERS. QSL ALL ZL8 CALLS TO THE CORRESPONDING ZL1 EXCEPT ZL0AJW/8, WHICH GOES TO ZL1BQD. BEFORE AND AFTER THE KERMADEC TRIP, ZL0AJW QSLS GO TO W6REC.

KAMPUCHEA. XU1SS HAS BEEN A REGULAR ON WEEKENDS ON 14335 KHZ FROM 1200Z ON, WITH HELP FROM VS6CT. QSL VIW JA1HQG.

TOKELAU. ZM7VU IS STILL ACTIVE AROUND 21026 KHZ AT 2300Z, 7005 KHZ AT 0600Z AND 3505 KHZ AT 0700Z. HE ALSO OPERATES ON 10101 KHZ AT 0800Z. QSL TO F6DYG.

MALAGASY REPUBLIC. 5R8AL HASSBEEN WORKED RECENTLY ON 21335 KHZ AT 1830Z.

MALAWI. STATIONS WERE HEARD WORKING LES, 7Q7LW, ON 3505 KHZ AT 0400Z, BUT HE WAS NOT HEARD IN NEW ENGLAND. HE ALSO OPERATES ON 7005 KHZ AT 0500Z.

TURKEY. TA2TAT WAS WORKED ON 21029 KHZ AT 1220Z. QSL TO BOX 95, SOKE, TURKEY.

SAN ANDRES. HK0HEU HAS BEEN WORKED ON 3794 KHZ AT 0415Z. HE SOMETIMES HAS A SKED WITH K2BU ON 1860 KHZ AT 0300Z. HK0FBF HANDLES HIS QSLS.

SENEGAL. DJ6SI IS SCHEDULED FOR A TRIP TO 6W5 STARTING MARCH 28. HE WILL OPERATE 160 THROUGH 10 METERS, CW ONLY. HE PLANS TO CONTINUE ON TO C5, THE GAMBIA, LATER.

WEST KIRIBATI. VICKY, T30CH, IS ON 14332 KHZ AT 1200Z.

COMOROS. D68AM CAN SOMETIMES BE FOUND ON 21285 KHZ AT 2000Z OR ON 14236 KHZ AFTER 1830Z.

CROZET. FB8WK OPERATES ON 7005 KHZ AT 0320Z.

160 METERS. ZS3E IS ON 1825 KHZ BETWEEN 0430 AND 0500Z, CP8HD ON 1817 KHZ AT 0645Z, AND 5B4EP ON 1848 KHZ BETWEEN 0230 AND 0400Z, SSB ONLY.

LEBANON. RAY, OD5AO, WAS WORKED LAST WEEKEND ON 14181 KHZ AT 2000Z. QSL TO F0DDA.

BAHRAIN. A92NH IS ON 14200 KHZ AT 2045Z AND 3795 KHZ AROUND 2300Z. QSLS GO TO W8LU.

REPUBLIC OF ZAIRE. ROGER, 9Q5RN, HAS BEEN ACTIVE ON 21308 KHZ AT 0000Z.

NIUE. ZK2RS HAS BEEN WORKED AT 0000Z ON 21307 KHZ.

NORTH COOK ISLANDS. AS OF WEDNESDAY, ZK1XL WAS STILL ACTIVE, BUT DEPARTURE IS IMMINENT.

(Sorry but the end of this transmission was lost)

PROPAGATION BULLETIN NR 12 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 12 1984   TO ALL RADIO AMATEURS

THE PARADE OF SUNSPOTS ACROSS THE VISIBLE SURFACE OF THE SUN THAT BROUGHT SOLAR FLUX PEAKS OF 180 ON JAN 29 AND 175 ON FEB 29 MADE ITS THIRD APPEARANCE LAST WEEK. STARTING FROM 100 ON MARCH 10 AND 11, THE SOLAR FLUX WAS UP TO 136 ON MARCH 15. THOUGH ACTIVITY APPEARS LOWER THIS TIME AROUND, FAIRLY HIGH FLUX NUMBERS SHOULD BE WITH US UNTIL THE LAST FEW DAYS OF MARCH. THIS WILL HELP TO OFFSET THE NORMAL SEASONAL DECLINE IN OVERALL DX PROPAGATION EXPECTED IN EARLY SPRING.

A GOOD IDEA OF THE EFFECTS OF HIGHER SOLAR FLUX VALUES CAM BE OBTAINED FROM THE PROPAGATION CHARTS IN QST FOR MARCH, PAGE 65. TAKE A HIGH LATITUDE PATH SUCH AS EASTERN USA TO EUROPE. NOTE THAT THE PREDICTED MUF FOR LATE MARCH IS UNDER 26 MHZ. FOR OPTIMUM CONDITIONS AND A SOLAR FLUX OF 108. EVEN ON THE BEST DAYS, THE NORTH ATLANTIC PATH WOULD BE BARELY USEABLE ON 28 MHZ, YET MANY CONTRIES OF EUROPE WERE COMING THROUGH WELL FOR SEVERAL HOURS ON MARCH 18 AS THIS BULLETIN WAS IN PREPARATION. DX CONDITIONS WERE MARKEDLY BETTER ON ALL LOWER DX FREQUENCIES AS WELL.

BULLETIN NR 13 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 7 1984 TO ALL RABIO AMATEURS

THE ARRL FILED TWO REQUESTS FOR RULEMAKING CONCERNING 160 METERS ON FEBRUARY 2. THE FIRST ASKS THAT POWER RESTRICTIONS ON 1900 TO 2000 KHZ BE ELIMINATED. THE SECOND REQUESTS THAT THE COMMISSION ALLOW F1 EMISSIONS ON 1800 TO 2000 KHZ. DETAILS WILL BE IN QST HAPPENINGS FOR APRIL.

ON MARCH 5, THE FCC DESIGNATED THE F1 REQUEST AS RM 4774. THE THIRTY DAY COMMENT DEADLINE ENDS APRIL 4. NO RULEMAKING NUMBER HAS BEEN ASSIGNED TO THE ELIMINATION OF POWER RESTRICTIONS PETITION YET.

BULLETIN NR 14 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 7 1984 TO ALL RADIO AMATEURS

FOLLOWS A MATTER OF PARTICULAR CONCERN TO RADIO AMATEURS IN MASSACHUSETTS. TO INSURE THE RETENTION OF THE COMMUNICATIONS

TOWER ON MT. GREYLOCK, AMATEURS MAY WISH TO CONTACT THEIR MASSACHUSETTS STATE SENATORS AND REPRESENTATIVES IMMEDIATELY TO URGE PASSAGE OF MASSACHUSETTS SENATE BILL 1625. THE BILL IS NOW BEFORE THE JOINT HOUSE SENATE COMMITTEE ON STATE ADMINISTRATION. AMATEURS SHOULD MAKE THEIR VIEWS ON SENATE BILL 1625 KNOWN TO THEIR STATE SENATORS AND REPRESENTATIVES SUCH THAT THE BILL WILL RECEIVE FAVORABLE ACTION BY THE COMMITTEE.

BULLETIN NR 16 FROM ARRL HEADQUARTERS NEWINGTON CT
MARCH 9 1984 TO ALL RADIO AMATEURS

THE FCC HAS RELEASED A NOTICE OF PROPOSED RULEMAKING ON THE SUBJECT OF REIMBURSEMENT OF OUT OF POCKET COSTS INCURRED BY VOLUNTEER EXAMINERS AND VOLUNTEER EXAMINER COORDINATORS IN CONNECTION WITH THE PREPARATION, PROCESSING OR ADMINISTRATION OF AMATEUR RADIO EXAMINATIONS.

FCC PROPOSES IN PR DOCKET 84-265 THAT VOLUNTEER EXAMINERS AND VOLUNTEER EXAMINER COORDINATORS MAY BE REIMBURSED FOR ACTUAL EXPENSES INCURRED, BUT TOTAL REIMBURSEMENT FOR AN EXAMINATION MAY NOT EXCEED FOUR DOLLARS. THE FOUR DOLLAR FIGURE MAY BE ADJUSTED ANNUALLY FOR INFLATION. FCC DOES NOT SPECIFY HOW THE REIMBURSEMENT FEE IS TO BE DIVIDED BETWEEN VEC AND VE. COMMENTS ARE DUE BY APRIL 16, REPLY COMMENTS BY MAY 1.

DETAILS WILL BE IN THE ARRL LETTER FOR MARCH 15 AND IN MAY QST.

QST DE K9EUI
HR PROPAGATION FORECAST BULLETIN NR 12 FROM ARRL HEADQUARTERS
NEWINGTON CT MARCH 19, 1984
TO ALL RADIO AMATEURS

THE PARADE OF SUNSPOTS ACROSS THE VISIBLE SURFACE OF THE SUN THAT BROUGHT SOLAR FLUX PEAKS OF 180 ON JAN 29 AND 175 ON FEB 29 MADE ITS THIRD APPEARANCE LAST WEEK. STARTING FROM 100 ON MARCH 10 AND 11, THE SOLAR FLUX WAS UP TO 136 ON MARCH 15. THOUGH ACTIVITY APPEARS LOWER THIS TIME AROUND, FAIRLY HIGH FLUX NUMBERS SHOULD BE WITH US UNTIL THE LAST FEW DAYS OF MARCH. THIS WILL HELP TO OFFSET THE NORMAL SEASONAL DECLINE IN OVERALL DX PROPAGATION EXPECTED IN EARLY SPRING.

A GOOD IDEA OF THE EFFECTS OF HIGHER SOLAR FLUX VALUES CAN BE OBTAINED FROM THE PROPAGATION CHARTS IN QST FOR MARCH, PAGE 65. TAKE A HIGH LATITUDE PATH SUCH AS EASTERN USA TO EUROPE. NOTE THAT THE PREDICTED MUF FOR LATE MARCH IS UNDER 26 MHZ, FOR OPTIMUM CONDITIONS AND A SOLAR FLUX OF 108. EVEN ON THE BEST DAYS, THE NORTH ATLANTIC PATH WOULD BE BARELY USEABLE ON 28 MHZ, YET MANY COUNTRIES OF EUROPE WERE COMING THROUGH WELL FOR SEVERAL HOURS ON MARCH 18 AS THIS BULLETIN WAS IN PREPARATION. DX CONDITIONS WERE MARKEDLY BETTER ON ALL LOWER DX FREQUENCIES AS WELL. ALSO OF INTEREST WAS A REAPPEARANCE OF 50 MHZ DX IN THE PAST WEEK, THOUGH THIS WAS OF THE NORTH SOUTH VARIETY LESS AFFECTED BY LOW FLUX VALUES THAN EAST WEST PATHS.

HIGH LATITUDE PROPAGATION WILL BE MOSTLY GOOD, WITH ONLY MINOR INTERRUPTIONS, MARCH 19 THROUGH 23. FROM MARCH 24 THROUGH 31, MORE FREQUENT AND SEVERE GEOMAGNETIC DISTURBANCES WILL DEGRADE HIGH LATITUDE COMMUNICATION, ESPECIALLY AROUND THE 25TH AND 30TH. TRANSEQUATORIAL PATHS WILL NOT BE GREATLY AFFECTED, AND AT 28 AND 50 MHZ THEY MAY BE IMPROVED AS THE DISTURBANCES CLEAR UP.

AMERICAN SUNSPOT NUMBERS FOR MARCH 8 THROUGH 14 WERE BETWEEN 45 AND 111 WITH A MEAN OF 68.6.

Does anyone have any experience with the Hy-Gain HF antennas? I'm
torn between getting the Explorer 14 (~ $300) or going whole-hog on
the TH7DX (~ $450).

I like the broad-bandedness of both of these, and like the idea of the
40m option on the Explorer 14. Is it simply a matter of "Ya gets what
ya pays fer" or is there a clear choice I'm not aware of yet?

At the moment, these two have been the most highly recommended. But I
am not opposed to considering other models (TH5), or other manufacturers.

I should have thought of asking the net earlier; I need (want) to decide
by 3-22 or 3-23 (a week).

Any information, pro or con, will be appreciated.

                    Thanks in advance,

                         John Burgess

qst de k9eui
hr dx bulletin nr 12 from arrl headquarters
newington ct march 23, 1984
to all radio amateurs

laccadives. many continue to receive vu7wcy cards mailed from two locations in the united states. the dxcc desk reports that both operations have been approved for dxcc credit and cards are being accepted.

china. by4aa was operated last weekend, apparently by visiting amateurs, and many north american stations were worked on 20 meter ssb. later this week, by1pk was heard with k7ja, his xyl wa7wtb, and ve7bc at the mike. signals were good but the competition was very keen. tom, ve7bc, was heard to say that the group would leave beijing on saturday and travel to by4aa for two or three days of operating. qsl all ssb contacts to ve7bc.

cambodia. xu1ss, cambodia. xu1ss, with yl operator kimsan, was worked in north america this week on 14175 khz at 1200 to 1300 utc. signals were better than ever reported before. qsl to ja1hqg. it is further reported that qsl cards for late december qsos are now being received by some.

kermadec. the new zealand/usa dxpedition to raoul island in the kermadec group began almost on schedule, sunday, march 18. callsigns are zl8amo, zl8aas, zl8bqd and zl0ajw/8. qsl as each operator instructs. look for good high speed cw from ron, zl8amo, usually 25 khz from the low edge on 10, 15 and 20 meters, or 5 khz up on 40 and 80 meters. also, zl0ajw/8 has been worked on both 30 meters and 160 meters cw. the original plan was to operate for ten days. the latest word is that the groups boat has been damaged by a tropical storm which hit the kermadecs this week, and departure may be delayed. they plan to operate as long as the fuel holds out, which could be another week or more. for north america, watch as follows, 10

meters 1900 to 2400z, 15 meters 2300 to 0400z, 20 meters 0400 to 1200z, and low bands 0600 to 1300z.

north cook. k6ozl is still at manihiki signing zk1xl. many have worked ron on seven bands, including qsos on rtty. due to transportation difficulty, he expects to stay at north cook at least another three weeks. qsl to zk1cg.

brunei. a new station in brunei is vs5ta, heard recently on 7004 khz at 1200 utc. no other information is available on this station.

yasme. lloyd and iris colvin wrapped up their easter island operation last week and returned to santiago for the weekend. they started yesterday from juan fernandez signing w6ql/ce0. they are expected to activate five bands, ssb and cw, over the next two weeks.

south shetland. a new operator, sandy, has been worked signing 4k1gag. this station has been active on 14225 khz at 0530z and 3646 khz at 1000z. qsl to uq2oc.

ethiopia. a surprise return of this rare country is et3ps, who has turned up sporadically on 15 and 20 meter ssb. he was last heard on thursday at 1300z on 14203 khz. the operator is tensay, and asks for qsls to box 6128, addis ababa. this is probably the same tensay who operated et3pg a few years ago.

dj6si expedition. baldur, dj6si, is departing march 28 for senegal and the gambia where he promises a six band cw effort. it is not known how long he will spend in each country, but the total trip is expected to be ten days. qsl to dj6si.

chad. f6bfn/tt went qrt on march 22, but says he will be replaced in two weeks by a new operator, fb8zq. watch for lots of cw.

heard and worked,

I have a PC board from a Xerox 820 computer and would like to obtain
schematics for it. Anyone out there have some I might borrow to figure
out this board? It is not the same as the Digital Research Computer
Big Board, thus the power connections are a mystery. Any assistance
at all in this endeavor would be appreciated.

Is there some kind of nostalgia here, or are we talking stone-age hardware?
Lower case is more readable. On any terminal that doesn't use proportional
spacing (i.e. all terminals not descended from the XEROX PARC effort) lower
case is much more readable, because it leaves more blank space. I am learning

to avoid net.ham-radio postings whose titles are in caps. What is the reason
for this barbaric practice?

I will be putting up a tower soon. I have a Hy-Gain TH3-Jr for 20-15-10
and am considering the addition of a 40M rotatable dipole (sort of like
a 1 element beam) above it.

I know of units made by KLM, Mosley, and Cushcraft but do not know
anyone with any experience with either one. From the literature I lean towards
the KLM right now but might easily be convinced in another direction.

Any thoughts on installation? 40M vs. 15M scares me! I have been advised
to keep at least 6ft of mast between the two antennas and to mount the 40M
dipole parallel to the boom of the tri-bander to reduce coupling. The
tri-bander should be lower on the mast since 40M needs the extra bit
of elevation more than the other bands.

PS. What's the best thing to put on hardware to prevent/reduce corrosion?
     (I known stainless steel HW is best. But what's second best?)

TNX for any replies.

qst de k9eui
hr propagation forecast bulletin nr 13 from arrl headquarters
newington ct march 26, 1984
to all radio amateurs

the parade of sunspots across the solar disk mentioned last week appears to have run its course. the timing of their appearance indicates that active areas seen since early march are mostly new ones, not what was left of groups that caused the solar flux highs of january and february. the solar flux curve after about march 6 shows little resemblance to those for the two previous solar rotations. from 136 on mar 15, the solar flux dropped gradually to 112 on the 25th, and it appears likely to decline further during the forecast week.

despite this drop, flux numbers are still above the base figure used for the propagation charts in march qst, so the forecast week should see generally good activity on 21 and 28 mhz. a mild geomagnetic disturbance, in progress at bulletin time, should clear by march 27, bringing better propagation in the higher latitudes for the next two days. another disturbance is expected about march 31.

it is of interest to 50 mhz dx enthusiasts that their band has been open for transequatorial dx in the southern tier of states during at least six afternoons since march 5. the author of this bulletin worked tg9nx and several lus from his florida location sunday afternoon, march 25. watch for this condition during, or immediately after, periods of high k index, in the afternoon hours local time. high solar flux is not required. opportunities should continue through early april, at least. strong signals from southern 10 meter beacons is a good warning. look especially for vp8ade, in the british antarctic, on 28.283 mhz.

american sunspot numbers for march 15 through 21 were between 84 and 107 with a mean of 95.4.

x
According to the April 1984 issue of "Monitoring Times" magazine, the FCC has released 10 new frequency pairs for cordless phones. The base / handset frequencies (MHz) are:

Ch	base	handset
1	46.61	/ 49.67
2	46.63	/ 49.845
3	46.67	/ 49.86
4	46.71	/ 49.77
5	46.73	/ 49.875
6	46.77	/ 49.83
7	46.83	/ 49.89
8	46.87	/ 49.93
9	46.93	/ 49.99
10	46.97	/ 49.97

This interim ruling will be in effect for 5 years. Future allocations will likely be made in other parts of the spectrum.

Cordless phone activity has been noted on these, and other frequencies:

Ch	Handset	Base
1A or 1	49.83	1.69
7A or 2	49.845	1.71
13A or 3	49.86	1.73
19A or 4	49.875	1.75
25A or 5	49.89	1.77

The reason for the "barbaric practice" of posting bulletins in upper case is that's the way they are received off the air! Yes, I use antique hardware for several reasons. I punch paper tape as I receive the transmissions. I don't know of a better, more reliable "backup". I have a Baudot/ASCII converter and could send the input directly to the computer, but phone lines and data links have a habit of going down without notice. I don't use my own computer in the ham shack because of the rf garbage it generates. There are enough problems with qrm and local line noise. I also use the tape for retransmission on the air.

I have also found that on hf, the slower the data rate, the more reliable the copy. So I only use the amtor or ASCII transmissions for fills if something was missed or garbled on the initial Baudot transmission.

I appreciate the comments I have received regarding upper vs. lower case and from now on they will be posted in lower case. Had I realized this preference, I would have done it sooner, but I have been posting bulletins for quite a few months and have not received any comments regarding lower case until several days ago.

Perhaps I should inquire if anyone objects to my limiting the line length to 63 characters. There are quite a few terminals in this area that are limited to a 64 character line. Also this length should certainly be acceptable to any printer used.

Speaking of posting things to the net, I wish everyone would leave at least one blank line at the beginning of postings so the text is separated from the header junk.

Mentioning "stone-age hardware" reminds me of the fact that we have had an unusual number of "accidental" transmissions on our local 2 meter rtty channel. These transmissions are ALL caused by those that use computers for rtty rather than the old

clunker printers. I would caution anyone using a computer to be aware that when power is shut down on the interface and/or modem, the transmit line sometimes defaults in the "on-the-air" state! This has occured most often with stations using vic-20's or 64's with some of the Kantronics or similar interfacing.

Does anybody have any ideas or information on adding a home-brew tone burst to the IC2AT. I shall be going to U.K. in summer, and they require a 900Hz tone to access repeaters.

Are there any VHF antenna gurus in NetLand?

I have a minor problem. I need to make a directional antenna which is tuned to 121.6 MHz. (I don't really need it to be broadband.)

Here's the rub. I have to be able to carry it through the woods *easily*. If someone knows of an article where I can find something like a foldable yagi design, I'd REALLY appreciate it. The design must also be forgiving enough that any idiot can unfold it, since I may not be the one who uses it.

I was thinking about using a wooden main boom that folds in half, with room for three or four yagi elements, and a handle that I would use to carry it with, but I can't think of any good way to fold the elements back that wouldn't begin to wear out after a few unfoldings. I also don't want to have ANY loose parts (free screws and such...), because if they get lost, I might be miles away from the replacement parts.

In fact, I'm not at all opposed to something other than a yagi. If you know of a quad design that is field portable, and suitable for VHF direction finding, I'd be happy to hear about it!

TNX in advance,

Mike Geipel
N4IXJ

P.S. - In case that was too easy a task, it would be cool if I could also receive (and transmit no more than 10 watts or so) reasonably well on 155.16 MHz. As I said before, 121.6 MHz is the frequency that the direction finding would be for. (But it'd be nice if perhaps a switch could add a tuning capacitor [?!?] to the elements, and the elements could be respaced [?@!?*!?], without requiring an owner's manual for guidance!)

P.P.S. If you're curious, this is for a group that does mountain rescue work.

This is a response to recent pleas for documentation on the Xerox 820, a version of the Big Board CP/M system which the Xerox Outlet Store ((214) 960-3367) has been selling for $50 per board.

Digital Research Computers
PO Box 401565
Garland, TX 75040
(214) 271-3538
For $5 they will send you a nice packet of schematics plus theory of operation plus directions on using their EPROM monitor. However, the Xerox version differs from theirs in at least three ways: parts are positioned and numbered differently on the board, connector pinouts are rearranged, and the last stages of the CRT driver have been redesigned.

B.G. Micro
PO Box 280298
Dallas, TX 75228
(214) 271-5546
These people advertise in the March "Nuts and Volts" magazine that they will sell you a blank copy of the Xerox 820 board with EPROMS and "complete schematics" for $29.95 plus $2 shipping. Perhaps you could persuade them to sell you the schematics alone. I have not dealt with them.

Xerox
1341 Mockingbird Lane
Dallas, TX 75247
Attn: Bonnie Campbell
The "820 Information Processor Development Guide", part number 9R80368, is available for $40. It is not clear whether this contains software information, hardware information, both, or neither. We have one of these on order.

We also have schematics on order from a third source whose address I do not have with me at the moment. I will post information to the net as soon as I get it, so the best advice I can offer is to sit tight for a week or so.

Meanwhile, anyone who has already gotten CP/M to run on an 820 board could do us all a great service by posting pinouts, advice on the BIOS, etc.

Incidentally, I purchased a switching power supply for the 820 board from the

Xerox Outlet Store for $50. It offers all the voltages the board needs, but
lacks the +24V needed for 8" floppies.--Steve

After a net announcement that Xerox surplus 820 boards (similar to the original Z-80 "Big Board") were available for $50 from Xerox surplus, about a dozen of us bought them. We have schematics for the original, but these are a bit different (nicer, in fact). We'd really appreciate it if the folks who posted the original message would share with us what they learned about connector pinouts, BIOS, etc, before we start tracing leads on the PC board (you're far ahead of us, since you have already gotten CP/M to run).

Our jury-rigged UUCP connection seems adequate for news, but is unreliable for mail, so I'll give a couple of addresses; or, if you don't mind posting a phone number, I'd be glad to call you.

While the 30-50MHz band is usually called a "public service band", the frequencies of interest are in the 49MHz 'kiddie walkie-talkie' portion. The new frequency pairs will open up more channels for the cordless sets, improve the quality of the link, and get these things out of the navigation/160M ham bands. The base-to-phone link was around 1750KHz AM and used the house

wiring for an antenna. This accounts for the lousey speech quality. The new units will be FM on both channels and most probably will have some kind of security code built-in for access. It must be remembered that this allocation is only temparary and that ultimately the cordless phones will end up at 900MHz, where the range is inherently limited, but will not suffer the noise and shielding problems of the present allocation. (If you think these phones are limited to 700 feet, think again. I've heard conversations on my 6M receiver that were 300 miles away, when there is a band opening.)

Thanks for all the responses on the Xerox 820 computer. Here are two
addresses I got from various people:

     Schematics: (availability not verified -- jcg)
               Digital Research Computers
               PO Box 401565
               Garland, Texas 75040

     Other items: (magazine dedicated to the Digital Research Big Board
                and the Xerox 820)
               Micro Cornucopia
               P.O. Box 223
               Bend, Oregon 97709
               503-382-8048

I need info on how to put a tone burst into the FT-208-RA as I am also
going to England this summer. However, the info I have (the RSGB handbook)
says that the tone frequency is 1750Hz NOT 900Hz.

Does someone out there want to unload their IC-4A or IC-4AT
so that they can get an IC-04A or IC-04AT.

We are interested in obtaining a USED and functioning unit
that can be converted to be controlled remotely.

If you have such a unit and are willing to sell it at a
reasonable price please contact me.

B.G. Micro, in Texas [(214) 271-5546] sells depopulated Xerox 820
boards for $30 (including documentation). They will sell a ~25
page document package for $5. However, they want a check for $5
mailed to them before they'll release just the documentation. I
sweet-talked the lady I spoke with (Tammy) into sending me the
documentation first, with the promise that I send her the check
in return.

There's also an ad for the Xerox outlet store (selling the used
820 boards for $50) in "Computer Shopper" magazine. They have lots
of other good stuff, like power supplies, etc.

Anybody have a good source of parallel encoded keyboards (I assume
that's what the 820 board needs)?

I would like to buy an IC2AT (maybe somebodies upgrading to the new IC02-AT).

I also need a mobile antenna that I can transport abroad in a suitcase.

Any offers?

I have determined the pinouts of the connectors on the Xerox 820-1
board. I have the schematic on order but was anxious to see this
board work so I resorted to real hardware hacking. I hope further
communication on this board will continue.

```
POWER SUPPLY CONNECTOR J5
    PIN #        SIGNAL NAME
      1             -12v
      2             +12v
      3             +12v or +24v to Disk Drive Conn. Pin 18
             /* Xerox supplies the voltage to the
                drive from a single supply.    */
      4             GROUND
      5             GROUND
      6             GROUND
      7             /* Voltage supplied TO J6-2 for Monitor */
      8             +5v
      9             +5v /* This voltage also goes to the Disk Drive
                     Conn. Pin 19                        */
-----------------------------------------------------------------
MONITOR POWER CONNECTOR J6
    PIN #        SIGNAL NAME
      1             GROUND

qst de k9eui
hr dx bulletin nr 13 from arrl headquarters
newington ct march 30, 1984
to all radio amateurs

thanks to k1xm, k1mm, w1trc and the southern new england dx association for the following dx information.

juan fernandez. lloyd and iris colvin are now operating from w6ql/ce0z. qsl via the yasme foundation.

kampuchea. xu1ss continues to be available on a list operation on sundays at 1100z on 14335 khz.

gabon. tr8dr has been active around 21020 khz at 1745z. qsls go to w2pd.

east malaysia. 9m6vw has been worked on 20 ssb around 1030z. others coming through at the same time include fb0yk, 4s7ea and 8q7av.

china. by4aa has been very active on 20 ssb at 1200z.

chatham islands. look for zl7oy on 14210 khz at 1430z.

korea. hl9ta has been active on 14030 khz at 1215z.

tokelaus. zm7vu has been on 28025 khz at 2230z, as well as on the other dx bands. qsl via f6dyg.

cameroons. tj1af has been active several days a week on 21335 khz between 1700 and 1800z.

turkoman. uh8hcs has been active on 7015 khz at 0100z. 4s7tpr has also been worked about the same time on 7010 khz.

cape verde. d44bs can be found on 21335 khz around 1900z.

tunisia. 3v8ps operates on 21292 khz at 1900z.

rtty. the bartg rtty contest produced activity from over 50 countries. some of the rarer ones were vu2, 5z4, ei2, ua0 and st2.

dxcc. tomorrow is the last day for submissions for the next honor roll listing to be received at arrl hq.

Are there any objections to having an arpa mailing list gatewayed to this group? This would be a new list, so there shouldnt be a sudden influx of traffic.

If I dont get five dissenting opinions in a week, Ill set it up. If I do (get those five messages), Ill probably ask again because more people may want it. Also, if you'd rather not have the stuff sent to the arpanet, please let me know, but it better be good...

(Actually stuff is already being sent to Xerox and SRI-TSC, but I havent seen any return traffic).

Lines: 206

Thanks to a good samaritan at SRI, I have a copy of some Xerox 820 documentation. For brevity, I will detail primarily the aspects that differ from the original "Big Board" from Digital Research Computers of Texas. Documentation for the original is still available from DRC (214) 271-3538. Xerox 820 documentation (which I haven't seen) is advertised by BG Micro (214) 271-5546.

Port Address Decoding: no differences

System PIO "A" side:

- Bit0 DVSEL 1
- Bit1 DVSEL 2
- Bit2 Side
- Bit3 Keyboard data available
- Bit4 8"/5.25" disk select
- Bit5 Assigned for future use
- Bit6 Display character set (?)
- Bit7 Bank switching (0=RAM, 1=ROM & CRT & RAM)

Interrupt structures:

Monitor uses mode 2 interrupts; I register is loaded with 0FF hex.
Priority chain is organized high to low as follows:

SIO CHANNEL A
SIO CHANNEL B
SYSTEM PIO PORT A
SYSTEM PIO PORT B
GP PIO PORT A
GP PIO PORT B
CTC CHANNEL 0
CTC CHANNEL 1
CTC CHANNEL 2
CTC CHANNEL 3

General purpose PIO strappings (J11) and pin assignments (J8):

J11:

odd numbered pins grounded

4	Port B READY polarity
6	Port B lower direction
8	Port A READY polarity
10	Port A upper direction
12	Port B upper direction
14	Port A STROBE polarity
16	Port B STROBE polarity
18	Port A lower direction

J8:

odd numbered pins are supposed to be grounded; they aren't, so you must ground at least one of them to the PIO chip so as to provide a signal ground to the peripheral device

```
          2    Port A STROBE
          4    Port A READY
          6    Port A bit 0
          ...
          20   Port A bit 7
          22   Port B STROBE
          24   Port B READY
          26   Port B bit 0
          ...
          40   Port B bit 7
```

CTC Strapping and I/O assignments (J10):

```
     System clock  2 1  Clock/trigger 0
     ZC-TO0        4 3  Clock/trigger 1
     ZC-TO1        6 5  Clock/trigger 2
     ZC-TO2        8 7  Clock/trigger 3
```

Video output connector pin assignments (J7):

```
     6-10 grounded
     3    Vertical sync
     4    Horizontal sync
     5    Video
```

Serial I/O connector pin assignments channel A (J4):

```
     1    Protective ground
     2    Transmit data
     3    Receive data
     4    Request to send
     5    Clear to send
     6    Data set ready
     7    Protective ground
     8    Carrier detect
     15   Xmit clock
     17   Receive clock
     20   Data terminal ready
```

Serial I/O strapping options for channel A (J9): No differences

Serial I/O connector pin assignments channel B (J3):

```
     1    Ground
     2    Receive data
     3    Transmit data
     4    Clear to send
     5    Request to send
     6    Data set ready
     7    Ground
     8    Terminal ready
     20   Data carrier detect
```

Keyboard connector pin assignments (J2):

14-25	grounded
1-7	bits 0-7
8	strobe
13	+5 volts via resistor

Disk drive connector pin assignments (J1):

20-37	grounded
1	not connected
2	8/5.25 select (grounded for 5.25)
3	not connected
4	index
5	select 1
6	select 2
7	side
8	HDLD
9	step in
10	step
11	write data
12	write
13	trk 00
14	write protect
15	read data
16	low current
17	ready
18	indep pin +12 or anything
19	+5

CRT RAM: 3000 hex through 3FFF hex.

I/O ports:

0-3	Channel A baud (writeonly)
4	SIO channel A data
5	SIO channel B data
6	SIO channel A control
7	SIO channel B control
8	GP PIO A data
9	GP PIO A control
A	GP PIO B data
B	GP PIO B control
C-F	Channel B baud (writeonly)
10	1771 status/command
11	1771 track
12	1771 sector
13	1771 data
14-17	CRT scroll register if 1, then loc 3000 is at bottom line; if 2, then loc 3000 is next to bottom line; if 17, then loc 3000 is top line, etc.
18	CTC 0
19	CTC 1

```
     1A   CTC 2
     1B   CTC 3
     1C   system data
     1D   system control
     1E   keyboard data
     1F   keyboard control

Power (J5):
     1    -12
     2    +12 CPU
     3    +12 disk
     4-6  ground
     7    +12
     8    +5
     9    +5

Power fed out to monitor (if needed) (J6):
     1    ground
     2    +12

Original Xerox 820 disk formats:

          8"   5.25"

for OS
Capacity  241K 81K

5.25" format is CROMEMCO format, 8" is IBM 3740 format

Monitor entry points are alleged to be the same as the DRC big board.o

Monitor commands are alleged to be the same, except:

     Test command is "X", not "T"
     Verify command is missing
     Boot command is "A", not "B"
     A "T" command connects the keyboard to the printer port like
     a "typewriter"

Setting MSB of displayed character gives blinking attribute.

The schematics came from BG Micro today, and it was well worth the wait.
They contain pages xeroxed from the xerox manual (ch 10) along with
some information for kit builders and six 10" x 15" schematic sheets.
All the vital information is here, so the $5 is well spent. The address
once again is:

     BG Micro
     PO Bx 280298
     Dallas, TX 75228
     (214) 271-5546

They apparently will not accept credit cards for the schematics, as they
asked us to send a check.

For those of you who can't wait, here are the vital connections for the board:

Video Output (J7)

pin	name
1	NC
2	NC
3	Vertical Sync
4	Horizontal Sync
5	Video
6-10	GND

Serial IO (J4)

pin	name

I have had considerable experience with rotatable 40 meter dipoles and
their interactions with tri-banders.

Yes, you are right on target with the idea of getting the 40 meter
dipole as high as possible. I have tried it both ways - with the
tribander on top, and with the 40 meter dipole on top.
There was a considerable improvement on 40 meters with the 40 meter
dipole on top. However, I should point out that I had 15 feet of
separation between the tribander and the dipole (the dipole was at
80 feet, and the tribander was at 65 feet).

You are also correct in being leary of interactions between the 40
meter dipole and the tribander. Even with 15 feet of separation,
I effectively killed the performance of the tribander on 15 meters.

(The performance on 20 meters also left something to be desired.)
The solution I have chosen is probably not universally applicable -
Separate towers for the tribander and the 40 meter antenna (I am
replacing the rotatable dipole with a 3 element monster).

A better alternative may be to obtain the driven element from a
Wilson tribander, Mosley TA-33, or Cushcraft tribander.
All three of these antennas have the capability of adding an additional
trap for 40 meters. Use this driven element in place of your Hy-Gain
tribander driven element - or, better yet, sell your Hy-Gain tribander
and put up the Cushcraft quad-bander.

Let me (and the net) know how you make out.

> a239 1443 24 Mar 84 AM-Phone Evidence,390 State Court Says Cordless
> Phone Conversations Not Private By BILL VOGRIN Associated Press Writer
>   TOPEKA, Kan. (AP) - Police can lawfully monitor and record
> cordless telephone conversations heard over an ordinary FM radio and
> use the recordings as evidence in court, the Kansas Supreme Court
> ruled Saturday.
>   In overturning a Reno County District Court judge, the high court
> decided that cordless telephone conversations are the equivalent of
> oral communications and not subject to wiretap laws.

Attorney General Robert Stephan hailed the ruling as ''a great decision for victims and for law enforcement.''

''The Supreme Court has obviously plowed new ground and, in my opinion, they plowed the furrows straight and true,'' Stephan added.

The state Supreme Court sent the case - involving charges of possession of cocaine and conspiracy to sell marijuana against Timothy and Rosemarie Howard of Hutchinson - back to court for a new trial.

Justice David Prager, in writing the decision for the court, said, ''Owners of a cordless telephone located in a private residence who had been fully advised by the owner's manual as to the nature of the equipment, which involves the transmission and reception of FM radio waves, had no reasonable expectation of privacy.''

In other words, the Howards had no valid expectation of privacy when they decided to use a cordless telephone which was advertised as having a range of 50 feet and is basically a radio unit.

Prosecutors alleged the Howards used their cordless telephone for drug dealing.

The conversations, which Judge William F. Lyle ruled were inadmissible as evidence, were recorded in 1982 after a neighbor of the Howards picked them up while he was randomly tuning a standard AM-FM radio.

The neighbor told police about the conversations and the Kansas Bureau of Investigation provided a tape recorder and tapes and asked the neighbor to record more communications.

A similar case is pending in Rhode Island, but is not expected to be resolved until later this year.

During oral arguments before the court last month, Herbert R. Hess Jr., attorney for the Howards, urged the court not to set an ''illogical precedent'' by allowing the use of the recorded conversations.

He contended that what occurs in the privacy of the home is protected constitutionally and statutorily and said a 1968 federal law governing wiretaps applies in this case.

This article contains information about the monitor supplied with the
Xerox 820 board. The Jump table has more entries in it than the manual
lets on. I have figured out what some of the 'undocumented' ones
do, but the explanations that I have given may not show *all* of the
features/ramifications of the functions. There are 2 major jump tables
in the monitor, one which contains the low-level operations (F000-F042)
and one that contains jumps to the higher level operations (F7FD-F805). The
manual (from BG Micro) only mentions the first 14 entries in the first
table.

Monitor Jump Table: Low-level Operations

ADDR Name Function
---- ---- --
F000 INIT   Cold start entry
         In : none
         Out: Does not return

F003 PROMPT   Warm start entry
         In : none
         Out: Does not return

F006 CONST   Console status test
         In : none
         Out: Status in A, FF if char avail, 00 otherwise

F009 CONIN   Console input
         In : none
         Out: Character in A (loop until char avail)

F00C CRTOUT   Memory-mapped CRT output
F00F CRTOUT   "   "   "   "
         In : Character in A
         Out: none

F012 SIOST   SIO Port B status test
         In : none
         Out: Status in A, FF if char avail, 00 otherwise

F015 SIOIN   SIO Port B input
         In : none
         Out: Character in A (loop until char avail)

F018 SIOOUT   SIO Port B output

```
          In : Character in A
          Out: none

F01B SELECT   Disk drive select
          In : Unit number in C (if drive not ready, keep present one)
          Out: Status in A

F01E HOME Restore to track 0
          In : none
          Out: Status in A

F021 SEEK Seek track
          In : Track number in C
          Out: Status in A

F024 READ Read sector into memory
          In : Sector number in C, Buffer pointer in HL
          Out: Status in A

F027 WRITE    Write sector from memory
          In : Sector number in C, Buffer pointer in HL
          Out: Status in A

(The following jumps are not listed in the manual--info may not be complete)

F02A DUMP Dump memory to screen
          In : ??
          Out: ??

F02D HOUTHL   Outputs 4 hex digits contained in HL to CRT
          In : Number to be printed in HL
          Out: ??

F030 HOUTA    Outputs 2 hex digits contained in A to CRT
          In : Number to be printed in A
          Out: ??

F033 ??   ??
          In : ??
          Out: ??

F036 COUTA    Outputs character in A to CRT
          In : Char to be printed in A
          Out: ??

F039 ??   Prints CRLF (does more, though)
          In : ??
          Out: ??

F03C CONIN2   Gets char like CONIN, but also echoes it to screen
          In : ??
          Out: Char in A (loops until char avail)
```

```
F03F ??   ??
          In : ??
          Out: ??

F042 PRSTR    Outputs string to CRT.  String immediately follows call,
          terminated by 04.  Returns to instruction following 04.
          In : ?? (uses return address for start of string)
          Out: ??

(The following are monitor high-level function calls)

F7F0 DUMP Dump memory routine
          In : ??
          Out: ??

F7F3 ??   ??
          In : ??
          Out: ??

F7F6 MEM  Memory examine/change
          In : ??
          Out: ??

F7F9
F7FC
F7FF
F802 ??   ??
          In : ??
          Out: ??

F805 TYPWR    Typewriter
          In : ??
          Out: ??

Organization: Pennsylvania State Univ.
Lines: 119

This article contains information about the monitor commands and the
character set for the video display.

This is a list of the functions provided by the monitor for the Xerox 820.
They are accessable on powerup from the keyboard.

Command	Use

Dump Dad1 ad2
     Dumps addresses ad1 through ad2. If ad1 is omitted, dumps
     0000 through ad2. Output can be held/restarted by hitting
     a key. 2 CR's will stop function and return to monitor if
     you don't want to see the whole dump.

Memory   Mad1
     Prints contents of location ad1, and accepts changes. To
     change, just type the new value (2 digits), to skip forward
     use CR, to skip backward use '-', any other to exit.

Xtest   Xad1 ad2
     Test for memory errors. Prints a '+' each time a cycle is
     completed, 256 cycles for every combination to be tested.
     Prints bad addresses if it finds any. Dumb name for command.

Fill Fad1 ad2 val
     Fills memory ad1 through ad2 with val. Reads block back to
     check for memory errors and reports any if found.

Copy Cad1 ad2 ad3
     Copies memory from ad1 through ad2 to memory starting at ad3.
     Compares copy with original and reports any differences to
     check for memory errors.

Goto Gad1
     Does a CALL to ad1. Control can be passed back to the monitor
     with a RET instruction.

Read Runit trk sect
     Reads a sector from disk and prints it in dump format. If an
     error occurs, it lets you know. 'disk error XX Uaa Tbb Scc'
     is the error where aa=unit number, bb=track number, cc=sector

number, and XX is the 1771 error code:

bit	R/W	Seek/Restore/Select
7	Drive not ready	Drive not ready
6	WR Protected	(not used)
5	WR Fault	(not used)
4	Not found	Seek error
3	CRC error	CRC error
2	Lost data	Cannot restore
1	(not used)	(not used)
0	=1	=0

Boot B (or A)
Loads bootstrap loader from disk and jumps to it. Reads tr0 sec1 into 0080 and then jumps to 0080. Loader cannot use bottom 256 bytes of memory.

Type T
Converts millions(?) of dollars in research into an electric typewriter. Reads from keyboard and outputs to printer port. Does not output to CRT.

Input Iport
Inputs byte from specified port and displays it. CR will do the same for the next port, '-' will do it for the previous port, any other exits.

Out Oport val
Outputs value to specified port and returns to monitor. Useful for initializing ports.

CRT information

Control characters

Hex	Use
00-07	None
08	Cursor left
09	Horizontal tab (tab stop every 8 postions)
0A	Linefeed
0B	Cursor up (wraps back to bottom of screen)
0C	Cursor right
0D	Carriage return
0E-10	None
11	Clear to end of screen
12-17	None
18	Clear to end of line
19	None
1A	Clear Screen

1B Escape
1C-1D None
1E Home cursor
1F Print char between 00 & 1F (special characters)

ESC is used for XY cursor positioning. ESC+'='+rowchar+colchar is the form where rowchar and colchar is the desired row/col with 32 added to it (20 hex).

The special characters are hidden in the control character section. To print a special character, prefix it with 1F. To print more than one, prefix each one with 1F.

The character set is standard ASCII from 20-7F. The character set is repeated in 80-FF with a blink attribute. If the cursor is on a blank spot, the standard block cursor will be displayed. If the cursor is on a character, the blinking version of the character will automatically be displayed.

Overall there is a smell of fried onions. (fnord)

Relayed from TAPR:

Anouncement, Announcement, . . .
We've found a modification to the TAPR modem which
will significantly improve performance under
ALL conditons. The change is extremely easy
to make, and involves one part change, and one small
re-calibration.

Part change on the Beta Board: change C25 from .01
to .0047 microfarads.
Part change on kit board: Change C20 to .0047
(it's the same cap. as in Beta mod.)
Finally, for both boards, change the 2211 center
frequency from 1700 to 1635 by using the calibration
routine for 1700Hz by entering the calibration
routines, and typing:
cal:3/1127
which will calibrate your normal 1700 freq. to
1635 Hz.

This mod should really improve things ina big way, and
we even think it will permit operation to 1800 baud!

This mod is entirely due to the efforts
of N7CL, who has been responsible for a number
of suggestions in the past, all of which
have improved our lot. (For those of you with an
interest in why this mod works: the cap. change takes
the 2211 from an underdampted condition to critical.)

Relayed from TAPR:

ANNOUNCELMENT, ANNOUNCEMENT, ... (CONTINUED)

Well, we were just a bit premature with the modification indicated on
our last installment. There's nothing wrong with the mod: it's exactly
what's needed. Unfortunately, after you make this simple mod the

demodulator will begin putting out garbage. This is due to another undocumented feature: pin 7 of the 2211 should be pulled to +12 volts instead of +5 volts, as is currently the case. The result of increasing the voltage is to increase the loop gain and the hysteresis in the data comparator. This in turn prevents the output data from containing double pulses, which is what you will see if you improve the loop filter design by replacing C20 (C25 on Beta boards).

The solution is simple, but now we're getting into a slightly more complicated modification: you need to route +12 volts to the pullup on pin 7 rather than +5. Next, you have to break the connection between the data out (pin 7) and the jumper connection leading to pin 27 of the HDLC chip. Using a VN10 (like the one used to switch the PTT on the kit board), use the modulator output to switch the state of the line leading to this jumper connection.
Attach the drain of this FET to the lead going to the jumper, attach the source to the nearby ground, and use the output coming from pin 7 of the 2211 to switch the gate. One final thing: you will need to pull up the drain end of the FET with about 5 k to +5 volts.

If you do all all these things, the demodulator works unbelievably:
We've been regularly running 1800 baud on good links here, and at
1200 baud the thing is just about unstoppable.

I can't seem to get mail to you, but then you don't seem to find my call in my postings either! Please add me to the call list.

And, now for some ham stuff.....

I am looking to buy a low-band rig in the coming months. I would prefer one with a general coverage receiver built in (like the Icom 751 or 745). Any experience with rigs like this? Thanks in advance.

QST DE K9EUI
DX BULLETIN NR 3   FROM ARRL HEADQUARTERS   NEWINGTON CT
JANUARY 20 1984   TO ALL RADIO AMATEURS

LACCADIVES. THE PRESENT GROUP SIGNING VU7WCY EXPECTS TO REMAIN ACTIVE UNTIL JANUARY 24. THEY HAVE BEEN WORKED ON 14195 KHZ BETWEEN 1200 AND 1300Z LONG PATH AND BETWEEN 1300 AND 1600Z SHORT PATH. THEY HAVE ALSO BEEN ON 21270 KHZ BETWEEN 1500 AND 1600Z AND ON 3897 KHZ FROM 0100 TO 0200Z.

COCOS ISLANDS. THE DXPEDITION SIGNING TI9J IS EXPECTED TO START UP AROUND JANUARY 21 AND WILL OPERATE ON ALL BANDS.

BURUNDI. 9U5JB CAN USUALLY BE FOUND NEAR 21275 TO 21280 KHZ AT 1900 TO 2000Z ON SUNDAYS. HE EXPECTS TO BE THERE FOR THE NEXT TWO YEARS. QSL VIA ON5NT.

TROMELIN. FR7AI/T HAS BEEN ACTIVE RECENTLY ON THE LOW END OF 15 AROUND 21010 TO 21025 KHZ FROM 1000 TO 1500Z.

DXCC DESK. DOCUMENTATION FROM TN8EE HAS BEEN RECEIVED AND APPROVED. CREDIT FOR TN8EE WILL BEGIN WITH THOSE APPLICATIONS DATED JANUARY 2 1984. THOSE PREVIOUSLY REJECTED FOR CREDIT WILL HAVE TO RESUBMIT THEM WITH THEIR NEXT ENDORSEMENT.

INDIA. VU2GI HAS BEEN WORKED ON 75 SSB AND 80 CW RECENTLY. LOOK FOR HIM ON 3897 AND 3521 KHZ FROM 0030 TO 0130Z.

PARAGUAY. ZP5XDW HAS BEEN WORKED ON 14025 KHZ AT 0100Z. HE PLANS TO BE ON 160 METERS ON JANUARY 28 AND 29 DURING THE CQ WW CONTEST. QSLS GO TO N4DW.

INDONESIA. YB0WR HAS BEEN WORKED RECENTLY ON 3790 KHZ AT 2130Z.

NIGER. 5U4MX HAS BEEN ACTIVE ON 3505 KHZ AT 0400Z.

CENTRAL AFRICAN REPUBLIC. TL8DX HAS BEEN WORKED ON 14225 KHZ AT 2230Z.

PITCAIRN ISLAND. YL VR6KY HAS BEEN CONTACTED FROM THE EAST COAST ON 3806 KHZ AT 1115Z.

SOLOMON ISLANDS. LOOK FOR H44IA ON 3787 KHZ AT 1215Z.

TOGO. 5V7JJ CAN BE FOUND ON 21005 KHZ AROUND 1700Z.

LLOYD AND IRIS. OPERATION IS EXPECTED TO BEGIN ANY DAY FROM CP6... BOLIVIA.

TUNISIA. 3V8AL IS ACTIVE ON 3505 KHZ AT 0330Z.

SAUDI ARABIA. HZ1AB HAS BEEN OPERATING ON 7001 KHZ AT 0400Z.

ICELAND. W3TB/TF WAS FOUND ON 3790 KHZ AT 2145Z.

I am interested in resuming a former very much enjoyed hobby, that of shortwave listening. Back in the middle 70's when I was last active in this hobby, the receiver that I used was a 50's vintage National HRO-60, and some 50's vintage Collins and Hallicrafter's equipment. I had rigged several long-wire antennas in the trees of my back yard, and had very successful results.

I have two problems:

1) I no longer have access to the equipment I mentioned above, and so I need to purchase a receiver. I would prefer to purchase some equipment similar to what I had before, but a local radio shop that carries used ham equipment says that the cheapest used 50's vintage receiver they carry (which is a Hallicrafter's) costs $400, which is more than I wanted to spend. I would prefer to spend in the neighborhood of $250-300 for a new or used receiver. Is this too little, or can I get a decent receiver (new or used) for that price range? Sensitivity and Selectivity are very important, the accuracy of the tuning dial I feel I am willing to skimp on, as long as the receiver has good sensitivity and selectivity.

2) What to do about an antenna--I am now living in a high-rise Condominium, and therefore cannot erect an outside antenna, nor can I dangle anything from my windows. I have heard that the metal finger stop on rotary dial telephones can make an excellent antenna for SWL purposes, is this true? Or can someone else suggest something better?

I hope I have not bored you hams too muchh with my SWL questions, but I don't know where else I can get this information. I would appreciate any comments, advice, or suggestions on where and how much I can purchase a General Coverage receiver for, plus what to do about an antenna, would be greatly appreciated.

Thanks,
Dennis

Older Receivers for SWL'ing

If you pay $400 for a 50's vintage receiver, you are paying
too much! Hamfests are full of older receivers selling from

$50 to $300, depending on model and condition. If you aren't adept at repairing older equipment, you must be extra careful when you buy. In this case, a private deal, along with a demonstration, may be better.

SWL'ing has changed quite a bit in 25 years. Today, digital frequency readout is almost a must! This realization was driven home after using an older Hammarlund HQ-180A receiver for a few weeks. The HQ-180A was a super, top of the line radio in the 60's, but the lack of digital readout, and resolution to only about 10 KHz wasn't good enough for modern, serious SWL activity.

Today's bands are much more crowded, so selectivity does indeed count. Cheaper solid state receivers are more prone to overload. If you live in an urban environment, with a high density of transmitters, this will be important.

My ICOM R-70, which covers 100 KHz through 30 MHz continuously, has digital readout and good selectivity. R-70's may be had new for about $600.

Indoor SWL Antennas

MFJ, Sony, and Dymek make active indoor antennas. These consist of a 3 or 4 foot rod and a solid state amplifier. The MFJ 1020 indoor unit I use works much better than expected, although still not as good as an outdoor antenna. It lists for $80 new, but was purchased at a hamfest for $20, and needed only one minor repair (replace a fiber washer).

You could go the route of running antenna wire around the inside walls of your high-rise condo. This is unsightly. A friend used the metal window frame in his Chicago apartment with an antenna tuner and 5 watt low power ham transceiver (Ten Tec Argonaut) to make dozens of foreign contacts. Making a two way DX contact is more difficult than just being able to hear a foreign station.

Remember, indoor antennas are particularly prone to locally generated interference, such as harmonics of the sweep circuit in a TV, home computer signals, light dimmer (SCR variety) noise, etc. Apartment dwellers are especially likely to encounter problems in this area, but don't

be
discouraged. Living several stories above the ground
can
help offset some of these handicaps.

I've never tried connecting anything more than a diode
and
headphones to the telephone finger stop. I'm glad people
are finding more uses for telephones!

More Information

There are other SWLs that read this news group.
If you need
more information, pick up a copy of Popular Communications
magazine on your newsstand. Although not particularly good
in technical areas, the frequency information and other
articles are very interesting.

More information on the TAPR modem upgrades, forwarded from Tucson:

MODEM NOTES

I've received several requests for alternative part numbers for the replacement cap, resistor and mosfet. The cap can be a garden variety ceramic, the resistor can be a 5 percent 1/4 w, and the mosfet can be either the originally specified VN10KM (available in places from RS) or an IRFDZ13 mosfet, which is RS part number 276-2073, and which should be in stock everywhere.

Again, I'd like people to let me know how this modification works out when they've put it in. Thanks

I recently heard a demo of the motorola AM stereo system (CQUAM) at the winter CES show. It was impressive,however they had their own transmitter; I don't know if they were operating at legal bandwidth.

They were promoting the fact that they were the system chosen by DELCO and had an Olds Cutlass set up as a listening room.

The preferred bandwidth response of the receiver is 10 KHz but the demo units had a wide and narrow bandwidth switch on them to accommodate stations broadcasting a preemphasized signal.

The People at the display were very helpful and in fact gave me data sheets on their decoder IC (MC13020) and two samples of the part to boot!

I have not built up the circuit yet (I am trying to scrounge up a 3.64 mHz ceramic resonator) but do have two stations in the Raleigh area broadcasting the signal.(WCHL Chapel Hill and WSOC Charlotte). I am planning to contact them to find out what kind of response they have been getting.(For all of you in other areas,Motorola has a list available of stations broadcasting CQUAM).

Has anyone out there tried the "MINIMUF" program on page 38 of
Dec. 1982 QST??

A friend has the program running on his VIC-20 but I can't get the
same results on my Heath H-8.

If anyone has used this program and can offer help, I can give
more details as to the problem areas.

Tnx Bob, K9EUI

A date for your diaries:

              Saturday, March 24, 1984

                RSGB National VHF Convention
         Sandown Park Racecourse, Esher, Surrey, England.

The Convention in an Annual Event coordinated by the RSGB. There are
various attractions including:
     - trade exhibition
     - private stalls
     - equipment test facilities
     - presentation of trophies
     - lecture programme

Lectures include topics such as "GaAs fets for all", G4SWX, "The 50MHz
Story", G3WSN and "Phase Locking of Gunn Diodes", G3BNL.

If you want more info, let me know...
Hope to cu there,
     de G6EZI.

DX BULLETIN NR 4 FROM ARRL HEADQUARTERS NEWINGTON CT
JANUARY 27 1984 TO ALL RADIO AMATEURS

LACCADIVES. THE VU7WCY EXPEDITION HEADED BY GOPAL, VU2GDG, SHOULD HAVE GONE QRT YESTERDAY, AFTER SIXTEEN DAYS ON THE AIR. SEVERAL THOUSAND CONTACTS WERE MADE ON 80 THROUGH 10 METERS WITH MOST ACTIVE DXERS HAVING GOOD OPPORTUNITIES TO WORK THEM. QSL TO VU2GDG. IT IS RUMORED, BUT NOT CONFIRMED, THAT THE SAME GROUP WILL TRY FOR THE ANDAMAN ISLANDS LATER THIS YEAR.

EASTER ISLAND. CE0ERY CONTINUES TO BE A REGULAR ON 20 METER SSB. WATCH AROUND 0100 TO 0200 UTC AT 14200 KHZ.

TROMELIN. YOLAND, FR7AI/T, CONCLUDES HIS ONE MONTH VISIT TO TROMELIN IN ABOUT TWO WEEKS. YOLAND WORKS FOR THE REUNION METEOROLOGY BUREAU AND MAKES REGULAR TRIPS THERE FOR HIS WORK. LOOK AROUND 5 TO 10 KHZ FROM THE BOTTOM END OF 10, 15 AND 20 METER CW. QSL TO HIS CALLBOOK ADDRESS BUT PUT FRANCE INSTEAD OF REUNION ON THE ENVELOPE.

AMERICAN SAMOA. KARL, DL1VU, CONTINUES HIS PACIFIC TOUR, PRESENTLY SIGNING AH8/DL1VU. HE WILL GO NEXT TO 5W1DC, THEN ZM7VU. QSL AS ANNOUNCED. KARL ESPECIALLY LIKES 80 AND 40 METER CW.

MACAO. PHIL, VS6CT, WILL SIGN CR9CT FROM FEBRUARY 1 THROUGH 5. QSL TO PHILIP WEAVER, BOX 10727, HONG KONG.

BOLIVIA. LLOYD AND IRIS COLVIN AND THE YASME EXPEDITION ARE NOW IN SANTA CRUZ, BOLIVIA, SIGNING W6KG/CP6. QSL AS USUAL TO THE YASME FOUNDATION.

BURUNDI. JIM BULLINGTON, 9U5JB, U.S. AMBASSADOR TO BURUNDI, HAS FINISHED THE INSTALLATION OF HIS TOWER AND TRIBAND QUAD.

HE IS ESPECIALLY ACTIVE ON SSB EACH WEEKEND. LOW BAND ANTENNAS WILL BE UP SHORTLY. QSL VIA ON5NT.

160 METERS. NEW STATIONS ON 160 METERS INCLUDE CT2DV, CT2BQ, T77V AND FC8TT. THIS WEEKEND, DON'T FORGET THE CQ 160 METER CONTEST. WATCH FOR A LOT OF UNUSUAL DX, AS LOW BAND CONDITIONS HAVE BEEN EXCELLENT DURING THE PAST FEW DAYS.

SABLE ISLAND. A ONE DAY OPERATION WILL TAKE PLACE LATE THURSDAY JANUARY 26 OR EARLY FRIDAY JANUARY 27 BY WAYNE, VE1CBK. HE WILL SIGN CY9CBK AND PLANS TO BE ONLY ON 160 METER SSB.

QSL CARDS. CARDS FROM BOTH KL7/P, PRIBILOF, AND XU1SS ARE NOW BEING RECEIVED BY MANY AROUND THE WORLD. BOTH ARE BEAUTIFUL PICTURE QSL CARDS WORTH WAITING FOR.

CHAGOS. VQ9WT IS AN AMERICAN STATIONED AT DIEGO GARCIA. WATCH FOR WALT ON 15 OR 20 METER SSB AROUND 1400 TO 1600 UTC.

SOVEREIGN MILITARY ORDER OF MALTA. THE JANUARY EXPEDITION IS OFF. THERE IS A SMALL POSSIBILITY OF A FEBRUARY 18 AND 19 OPERATION, BUT APRIL ACTIVITY IS MORE LIKELY.

HEARD AND WORKED,

CALLSIGN	FREQUENCY	TIME
4K0ABY	7002 KHZ	0735Z

I was able to get the MINIMUF program from Dec. 82 QST working "correctly"
on my C-64.
I put the word "correctly" in quotes because I feel some erroneous
assumptions have been made in the design of MINIMUF.
Specifically, the program consistently predicts ridiculously high
MUF's during the summer months on northern paths.
For example, try the North America - Europe path for a solar flux
of around 200 (near the peak of the sunspot cycle) during July.
Then think about your own experiences on 10 meters during July a few
years ago.

I have another program, obtained third hand. The person who gave it
to me says it was in one of the RSGB publications. This program
gives the LUF (based on assumptions I don't know), MUF and HPF (highest
possible frequency). The results this program gives are far more
believable than MINIMUF. If there is interest, I will post on the
net.

73,

Steve London, N2IC

QST DE K9EUI
PROPAGATION BULLETIN NR 6 FROM ARRL HEADQUARTERS NEWINGTON CT
FEBRUARY 6 1984 TO ALL RADIO AMATEURS

LATE JANUARY PROVIDED A GOOD EXAMPLE OF THE SOMETIMES ERRATIC AND ALMOST UNPREDICTABLE NATURE OF SOLAR ACTIVITY. AFTER MORE THAN TEN WEEKS OF THE LOWEST FLUX AND SUNSPOT NUMBERS SEEN SINCE 1977, THE SUN CAME ALIVE SUDDENLY AROUND JANUARY 20. SEVERAL SUNSPOT GROUPS, LARGER THAN ANY SEEN IN A YEAR, APPEARED ON AREAS OF THE SUN THAT HAD BEEN ALMOST QUIET IN RECENT MONTHS. THE FLUX ROSE 80 POINTS TO 178, THEN ON TO 180 BY THE 29TH. THIS WAS HIGHER THAN AT ANY POINT IN THE PAST YEAR. A STEEP DOWNTURN BEGAN FEBRUARY 1, THE FLUX DROPPING TO 118 BY THE 5TH.

WE WERE HEADED INTO A QUIET INTERVAL AS THIS BULLETIN WAS ISSUED, AND PROPAGATION WILL BE MORE STABLE, BUT WITH LOWER MUF, THROUGH ABOUT THE 17TH. THE FLUX AND THE MUF WILL PEAK AGAIN LATE IN THE MONTH, THOUGH PROBABLY NOT TO THE EXTENT THAT THEY DID IN LATE JANUARY. DX CONDITIONS WILL BE MOSTLY BETTER, MAINLY BECAUSE OF THE SUN'S MORE FAVORABLE POSITION FOR THE NORTHERN HEMISPHERE.

AMERICAN SUNSPOT NUMBERS FOR JANUARY 26 THROUGH FEBRUARY 1 WERE BETWEEN 91 AND 127 WITH A MEAN OF 100.3.

Where can I find out my ARRL VUAC grid location (those funny numbers
like EN-61) used for VHF and UHF co-ordinating? The maps I have seen are
too large a scale for me to figure out which of 4 squares I am in. I
don't have an official map - I've just seen pictures in QST, and from
all I can tell, I am very close to where 4 of the squares meet. I am on the
near southwest side of Naperville, about a half mile or so NE of the
intersection of 75th and Gartner, as the crow flies. Does anyone locally
know where those lines meet, and which side I am on, or at least how I
find out ?

Thanks,

--

x

A previous article claimed that running indoor swl antennas
was unsightly. This is not necessarily so. Using #30 AWG
wire-wrap wire (kynar) of the appropriate color, at the
top edge of the wall is almost undetectable. Use small
pieces of Scotch transparent tape to secure the wire every
three feet or so. The wire need not be straight; length is
more important. This long wire (say 50 ft.) with an
antenna tuner is a fine performer on all bands.

          sam (for Karl) @ Xerox

Is it possible for the Ham Radio fraternity to get some use out of the
un-commercially-usable Westar VI satellite? Hams are used to tracking
satellites in 200 mile high orbits, right? Just think of it -- a $50
million satellite to play with...and you thought Oscar was fun!

Subject: Westar VI Found in Perfect Health
Message-ID: <2575@alice.UUCP>
Date: Sun, 5-Feb-84 19:48:05 PST

A ground station in California today (Sunday) found the
Westar VI satellite and succeeded in changing its atiitude
so that it could recharge itself from the sun. Communications
were established with the satellite, and Western Union
reported it to be in perfect health. However, its elliptical
orbit of 195 to 205 miles renders it virtually useless, and with
no way to boost the orbit, Western Union is calling the satellite
a total loss.

Here is a program for MUF estimation which I have found to give
considerably better results than MINIMUF.
It is reputedly from one of the RSGB publications.
The version listed below runs on Commodore 64 BASIC.

I find the "Short Path" results to be rather accurate, but the
"Long Path" results somewhat questionable.

Any comments, questions, etc. would be welcome.

Steve London, N2IC/0

Lines: 70

I loaded the "RSGB MUF" program into my computer last night and thought
I would submit the following comments:

After a few changes it at least ran. plugging in numbers from the
sample run shown in the minimuf article in Dec. 1982 QST, I do not
get anywhere near the same muf values. So there are still problems.

To get anything to happen I first had to remove the (N) contained
in various lines from 750 - 1470. (What is this (N) for anyway?)

The SF (for solar flux) in lines 180 and 185 had to be changed as
my system calls more than one letter a string, so I called it S1.

I then changed lines 190-210 so I could enter any "local" latitude
and longitude.

The result (other than the muf readings) was that the "BEARING"
printout was erroneous in some cases. I was a bit confused by
the positive or negative for North, South, East, West.
North and East should always be positive, and South and West
should always be negative. Removing line 160 corrected the
BEARING error.

I still do not know what "ROUTE" means. It does not enter into
any calculations so I removed line 100. Later I removed line 300
as being unnecesary.

Line 460 was changed to just print out the bearing.

Finally, the following changes/additions were made:

```
1640 INPUT "ENTER 1 TO CONTINUE, 0 TO END";Z1
1650 IF Z1=1 THEN 80
```

```
1660 IF Z1=0 THEN END
```

The following lines were redone (with 185, 220-290, 330-450 as is):

```
80 CLEAR
90 P1=3.141592654:J9=P1/180
100 INPUT "MONTH NO.= ";M0
110 INPUT "SOLAR FLUX NO.= ";S1
115 REM SOUTH LATITUDES & WEST LONGITUDES ARE ENTERED AS NEGATIVE NO'S
120 INPUT "YOUR LATITIDE= ";L5
130 INPUT "YOUR LONGITUDE= ";W5
140 INPUT "DX LATITUDE= ";L6
150 INPUT "DX LONGITUDE= ";W6
460 PRINT "BEARING IS "INT(H9/J9+.5)"DEGREES"
465 X1=-ATN(H1/SQR(-H1*H1+1))+1.5708
470 X2=X1*3956.1
475 PRINT "RANGE IS "X2"MILES":PRINT
```

Some of this was done in order to enter thing in a more orderly order.
Lines 460-475 are from the ARRL antenna handbook to print out
the distance to the DX station.

Final comments:

I believe there is something wrong with the "long or short path" lines.
I'm not sure what, but something does not look right. This is in lines
220, 230, 240, 260, 380, and 530. Any comments?????

Also, is it possible that in line 530, it should be .01745 instead of
.0172? (pi/180)???

Thanks again to N2IC for posting this program. I would be interested
in what luck others have with it too, as well as what computer you use.

73 Bob K9EUI

I have heard rumors of CP/M RBBS late nite, automatic message exchange networks (like UUCP?). I am interested in using this technique to exchange mail between my Packet Radio RBBS and other packet LAN's. If anyone has any information on protocols, people doing this, please let me know.

If such systems don't exist, I have a draft for an inter-lan message protocol and would be interested in sharing my ideas.

Comment in passing. I have modified BYE.ASM into several versions. One allows access from a normal VHF-FM Amateur RTTY station, and the other from a Amateur Packet Radio station though my TNC. I am currently using RBBS.BAS for the bulletin board, but am in the process of writing a system that is specially tailored to Amateur Packet Radio (using ideas stolen from Frank Wancho's RBBS4.C).

Thanks to everyone who called/mailed me responses. I now know my grid location is EN51ws, which will be printed up on my new (only) QSL cards.

I received two programs to do the calculation. One is in BASIC from Dave

Knight KA1DT. If I ever get my home system up and running, it will be resident for sure. The other came from Ron McConnell W2IOL, and is in F77 Fortran. He sent me a followup message giving me permission to post it to the net for him, since his new machine (whuxi) is having problems. So here goes. Only one note about data entry: a leading zero MUST be used where called for. For example, use "09.3" minutes, NOT " 9.3".

For anyone with UN*X 5.0, just "f77 vucc.f; a.out" and answer the prompts:

```
C      13 January 1983 and 18 October 1983
C
C                      Ronald C. McConnell, W2IOL
C
C       VUCC, VHF/UHF Century Club grid locator
C
C      "VUCC" determines the grid location in the "Maidenhead"
C         format as adopted by the IARU
C         given latitude and longitude of a QTH
C            in integer degrees ( no decimal ) and decimal minutes
C
C       The 1st and 2nd characters ( A to R ) define an area, "field,"
C          20 degrees in longitude by 10 degrees in latitude.
C
C       The 3rd and 4th characters ( 0 to 9 ) define an area, "square,"
C          2 degrees in longitude by 1 degree in latitude.
C
C       The 5th and 6th characters ( a to x ) define an area, "sub-square,"
C          5 minutes in longitude by 2.5 minutes in latitude.
C            ( not needed for VUCC award )
C
C                    dd mm.m    ddd mm.m
C        Examples:  40 46.9 N, 074 41.4 W   =  FN20ps
C                   40 46.9 S, 074 41.4 E   =  ME79if
C
C       Note that latitude and longitude define a point.
C                 Grid location defines an area.
C
C        Characters 1, 3 and 5 start at 180 longitude and
C           increase alphabetically or numerically to the east.
C           Points on grid boundaries round to the east.
C
C        Characters 2, 4 and 6 start at 90 south latitude and
C           increase alphabetically or numerically to the north.
C           Points on grid boundaries round to the north.
C
C      See QST, January 1983, p49, "VHF/UHF Century Club Awards"
C           &   October 1983, p52, "Grid Locators for South America"
C        by John F. Lindholm, W1XX, ARRL Com. Mgr.
C
C       VUCC is written in a subset of fortran 77.

UOSAT-B SPACECRAFT STATUS REPORT   19TH FEB 1984 VAFB

First, apologies for the lack of communication from the UO-B team over the week or so - things have been just a little hectic with the final preparations for the launch of the UOSAT-B spacecraft still currently scheduled for 09:59 on 1st March. The UO-B launch crew of ten have been busy at the Western Test Range, Vandenberg Air Force Base, Ca carrying out experiment calibrations, last-minute de-bugging, application of the thermal surfaces and final, careful cleaning. The primary payload, LANDSAT-D', is a super-clean mission and has necessitated a rigorous contamination control program for UO-B, culminating in an unscheduled thermal vacuum bake-out when it was feared that some contamination had been picked up on the spacecraft from the original thermal vacuum tests. Cold finger and swab samples showed up some pthalate ester contaminants from the chamber mechanisms and there was a concern that some of this may have been deposited on the spacecraft interior where it would be difficult and dangerous to remove using solvents.

The spacecraft was shipped down to MDAC (Huntingdon Beach) for a bake-out and contamination assessment on Thursday 16th. The tests commenced that night and within a few hours it became apparent that the spacecraft was, in fact, extremely clean and the planned

24/36 hour tests were cancelled and the spacecraft removed from
the chamber and shipped (with a clean bill of health) back to
VAFB! This unscheduled activity has delayed the final tests and
preparations of UO-B and the spacecraft will now mate with the
launch vehicle at 1600 hrs local on Wednesday 22 Feb.

So far, the preparations for launch have proceeded well. There
have been a number of problems of which only a few remain
unresolved and work continues to overcome these in the next few
days. Time is very short and everyone is putting maximum effort
to ensuring the best possible spacecraft within this extremely
tight schedule. The spacecraft systems and experiments are
functioning well - a detailed Flight Status Report will be
released after the vehicle mate (if the telemail facility still
exists!) and details of the spacecraft calibrations/data formats
will appear over the next few days.

Thanks to all those who have sent their good wishes,
 Martin Sweeting G3YJO   UOSAT

Subject: UoSAT-B Prelim Telemetry
Message-ID: <2289@allegra.UUCP>
Date: Mon, 20-Feb-84 17:55:03 EST
Article-I.D.: allegra.2289
Posted: Mon Feb 20 17:55:03 1984
Date-Received: Tue, 21-Feb-84 08:13:20 EST
Organization: Bell Communications Research, Inc
Lines: 183

Following is some very preliminary info on the default telemetry format
for UOSAT-B. Some items have not yet been calibrated, others have been
but the equations aren't where I am. This is being entered during some
planned s/c down time. The DCE is in good shape so
I've got some spare time.

2/19/84   Preliminary UOSAT-B telemetry data format. Currently
           incomplete. All equations subject to change. Some
           item names will change, although the actual function of
           all telemetry items has now been fixed.

Checksummed TLM format. Channel format is:

nnvvvc

nn - channel number
vvv - value
c - To compute checksum, convert each ascii
character into the binary, e.g. 'A', which
comes in as 41H becomes 0AH. Exclusive OR
all 5 values. Convert the lower four bits
of the XOR answer to an ascii hex digit, e.g.
0BH becomes 42H, this character is the checksum.

A 1Eh cursor home character preceeds UOSAT-2 in each frame
The number after UOSAT-2 on the header line is the date
in YYMMDDWHHMMSS, W is day of week, 0-6. The date below
is bogus, it wasn't initialized after the s/c was powered
up. The s/c was in the Bldg 836 clean room when this
frame was taken. Some of the data is valid.

```
UOSAT-2           0000010040621

00515101039B020112030102040235050 28F06025107031508032909026D
10515011000012005613010314000515000416000717736418736B19736A
20515321032222667723000124001725000726077427736728736829736 9
30515231016532284F330000340007350305360005377366383 53E39353F
40763641000542688043000744000045056246000247736148353949346C
50561751017252661653263154111055852F56000357306758736F593539
602105617BC762800C630041641003651C0E66140567340668000E69000F
```

Non-checksummed frame. Everything is the same as above expect
that the checksum character becomes a space. This format is
more pleasing to the human eye.

```
UOSAT-2           0000010040630

00515 01035 02010 03010 04023 05028 06025 07031 08032 09026

```

A dwell format is also available, in which only selected
channels are displayed. The channels can come out in any

order, in checksummed or non-checkedsummed format. The
UOSAT-2 and time stamp may or may not be included.

57	Battery temp	T=(480-N)/5 C
58	2.4GHz beacon temp	T=(480-N)/5 C
59	CCD imager temp	T=(480-N)/5 C
60-67	Status points 1-96	

(the status points have been keyed in already at surrey, I'm not
 going to key them in again, there are a whacking great lot of them
 (I'm picking up the lingo), I'll append them when Mac forwards the
 file from the UK.)

Multiplexed Battery Scheme (channel 53)

Six consecutive TLM frames will carry the total volts, the following ten frames will be individual cells, starting with cell #10. Each cell has its own equation.

Cell	Equation
ALL	
10	
9	
8	
7	
6	(not available, in Surrey)
5	
4	
3	
2	
1	

The DCE currents will have small counts even when the DCE is off. We think this is due to the +10 coming in from the Nav Mag lines. If the Nav Mag is off (unlikely), the DCE currents will be zero when both it and the Nav Mag are off.

Ps, the beacon freqs are
145.825 (yes, the same as uos-1, but
 6 hours apart)
435.025
2401.0

The tones are the same as uosat-1, but the
sense of mark and space are reversed.

Harold.

Subj: uosat-b status points

Here are the status points as supplied by Mac back at Surrey, and
updated at VAFB. This is preliminary and subject to change. Some
items are undefined. These values are encoded in TLM channels
60-67, 12 points per channel, e.g. channel 60 has status bits
1,2,3,4,5,6,7,8,9,10,11,12 in that order. Thus, 60400 means status
point 2 is set, 1, and 3-12 are reset.

Phil,

Here are some parameters from a set of 200 that I thought you might
be able to use to get a set of AMSAT standard keplerian elements for
UOSAT-B.

Launch.   17:57.00 UTC March 1, 1984
UOSAT-B deploy. Launch + 4300 seconds.

Following values are at the time of UOSAT-B deploy.

Rotation of line of Apsides, + is in the direction
     of the orbit: -3.12357 deg/mean solar day

Ascending node right ascension (ECI system): 175.3923 deg

Eccentricity: .4139783 E-3

Apogee: 372.62 n.mi

Perigee: 369.46 n.mi

Inclination: 98.25967 deg

Nodal regression, east is positive: 1.00073 deg/mean solar day

True anomoly: 226.9766 deg

Argument of perigee: 174.16983

Instantaneous geocentric latitude: 40.629187

Instantaneous longitude, positive west: -29.650437

Period: 98.5 min

Time since perigee: 3726.775 sec (may be bogus, since 50 seconds
                                   later, this value is 3549.826)

Let me know if there are any other values or info you need.

The figures I've got are for the second stage. The last time the second
stage and uosat-b are in similar orbits is launch +5453 seconds. At that
time, the lat. is 67.208371 and long. is 127.766825.

[The preceeding messages have been relayed from Harold Price, NK6K, who
is with the U of Surrey launch campaign team at Vandenburg Air Force
Base. I will be posting additional information on the launch of UoSAT-B
as it arrives. -Phil, KA9Q]

Lines: 48

I just made a phone call to Millstone Hill and received the following
information regarding the UoSAT-B launch events, relative to T = 0:

```
Event                   hh:mm:ss (relative to liftoff)
1st stage main engine cutoff:    00:03:47
Vernier engine cutoff:      00:03:53
Stage 1 separation:         00:03:55
Stage 2 ignition #1:        00:04:00
Stage 2 cutoff #1:      00:10:50
Stage 2 ignition #2:        00:54:04
Stage 2 cutoff #2:      00:54:17
Landsat separation:         00:59:10
Stage 2 maneuver start:     00:59:15
Stage 2 maneuver stop:      00:59:52
Uosat-B separation:         01:11:40
Stage 2 ignition #3:        01:30:53 distancing maneuver
Stage 2 cutoff #3:      01:30:58
Stage 2 ignition #4:        01:36:43 depletion (deorbit?) burn
Stage 2 cutoff #4:      01:37:05
```

I also got some numbers for preliminary orbital elements. These do not
necessarily agree exactly with the numbers Harold gave, so I suspect
either they were derived from a different source, or apply to different
instants in the launch sequence. The only major apparent discrepancy is
in RAAN, but we've seen this problem before - it probabably has only to
do with a different convention in coordinate systems.

```
Satellite: uosat-b
Epoch time:      84061.79768519 (separation)
   Thu Mar  1 19:08:40.000 1984 UTC
Element set:     prelaunch
Inclination:       98.2596 deg
RA of node:       124.2426 deg
Eccentricity:    0.0004100
Arg of perigee:   174.4207 deg
```

```
Mean anomaly:     226.7604 deg
Mean motion:   14.61025794 rev/day
Decay rate:              0 rev/day^2 (none given)
Epoch rev:               0
Semi major axis:  7065.080 km
Anom period:     98.560888 min
Apogee:            690.030 km (These I computed from other MH numbers,
Perigee:           684.236 km and agree pretty closely with Harold's numbers)

From this, I can see that the first pass visible over the eastern US
will occur just after 00:00 UTC on 2 Mar.

Phil

QST DE K9EUI
ARRL DX BULLETIN NR 7 FROM ARRL HEADQUARTERS
NEWINGTON CT  FEBRUARY 17, 1984
(MODIFIED SLIGHTLY BY K9EUI)
TO ALL RADIO AMATEURS BT

COCOS ISLANDS.  AN EXPEDITION IS EXPECTED TO BEGIN OPERATION ON
FEBRUARY 17.  ITS TI9 CALL IS UNKNOWN.

KERMADEC.  THE JIM SMITH DXPEDITION IS SCHEDULED TO START MARCH 21 OR
12 AND RUN FOR TEN DAYS.  THE OPERATORS WILL BE VK9NS, ZL1AMO, ZL1BQD
AND ZL1AAS.

COMOROS.  D68WB IS A NEW OPERATOR, BILL, A MEDICAL DOCTOR FROM THE
U.S.  QSL TO BILL BARNETT, BOX 504, MORONI, COMOROS.

NORTH COOK ISLANDS.  ZK1MA AND ZK1XL PLAN TO OPERATE FOR A MONTH,
BEGINNING FEBRUARY 18, ON 160 THROUGH 10 METERS, MOSTLY CW.  THERE
```

WILL BE SOME RTTY OPERATION. QSL DIRECT ONLY TO VICTOR RIVERA, ZK1CG, BOX 618, RAROTON, COOK ISLANDS, SOUTH PACIFIC VIA N.Z.

REPUBLIC OF GUINEA. 3X4EX HAS BEEN VERY ACTIVE. CHECK 14235 KHZ AT 2300Z, 3790 TO 3800 KHZ AT 0100 TO 0200Z AND AT 0600Z. QSL TO N4CID.

BURUNDI. 9U5JB WAS WORKED LAST WEEKEND AT 1630Z ON 28610 KHZ AND HAS ALSO BEEN WORKED ON 80 AND 40 METER SSB.

LLOYD AND IRIS. THE COLVINS PLAN TO OPERATE FROM /ZP5 FOR TWO MORE WEEKS, THEN TO CE0, EASTER ISLAND, AND THEN JUAN FERNANDEZ.

UGANDA. G8GRN/5X WAS WORKED ON 14180 KHZ AT 2100Z LAST WEEKEND. QSL TO G4CTQ.

FALKLAND ISLANDS. VP8KF IS VERY ACTIVE ON CW. CHECK 21020 KHZ AT 1500Z. QSL TO G3PVW.

RTTY. FB8WK, CROZET, IS WILLING TO MAKE RTTY SCHEDULES.

MAURITIUS. 3B8CF IS ON 3505 KHZ REGULARLY BETWEEN 0200 AND 0300Z.

THE GAMBIA. C53AL IS ON NIGHTLY AT 0300Z ON 3792 KHZ SSB. QSL TO KA2CDE.

BOTSWANA. FIVE A22 OPERATORS WILL BE ACTIVE ON 80 THROUGH 10 METERS, SSB AND CW, FROM 0000Z ON THE 18TH TO 2400Z THE 19TH, IN THE FIRST BOTSWANA DX ASSOCIATION QSO PARTY. FOR A COMMEMORATIVE QSL, QSL TO CLARENCE A. ALLISON, A22CA, BOX 29, SELEBI PHIKWE, BOTSWANA, AFRICA.

WAKE ISLAND. AH3AA/KH9 HAS BEEN QUITE ACTIVE. LISTEN AROUND 21300 KHZ AT 2100Z. QSL VIA W1ISD AR

--
Is there still a Barry's Green Flyer for surplus vacuum tubes?

I mainly need the address so that I can send for one, can anyone
furnish such an address to me?

Any other sources of surplus vacuum tubes? (name & address)

(Just recently got a Tektronix 551 at a steal, but not equipped with
tubes and need a source to equip it to get it operational.)

Please reply to Ed Baldwin, hou2h!atttl

Many, Many thanks for your replies

Ed

MANY OF YOU HAVE PROBRABLY BEEN FOLLOWING RALPH AND THE GANG IN IOWA
EFFORTS TO DEVELOPE A LOW COST PACKET BBS AROUND THE SINGLE BOARD
CP/M COMPUTER CALLED THE BIG BOARD. MANY MAY NOT BE AWARE THAT THE
ORIGINAL XEROX 820 WAS ALSO DESIGNED AROUND THIS SAME UNIT. XEROX
WAS NEVER SUCCESSFUL WITH THIS PRODUCT (I.E. THEY LOST THERE SHIRT)
AND FOR SOME TIME HAVE BEEN WHOLESALE'N THE REMAINING STOCK AND
"PULL-OUTS" AT LOW PRICES. THE XEROX SURPLUS OUTLET IN DALLAS
HAS GOTTON DESPARATE (SP) ANYWAY THEY ARE SELLING THE XEROX 820
BOARD FOR $50 !! THESE UNITS WERE PULLED FROM SERVICE IN WORKING
CONDITION AND REPALACE WITH THE 820 BOARD. THE BOARDS CONTAIN
64K RAM SERIAL AND PARRALLEL, CTC, 24 X 80 TERMINAL, FLOPPY CONTROLLER
FOR 5.25 AND OR 8" DRIVES. ADD POWER A KEYBOARD MONITOR AND DRIVES
AND YOU ARE UP AND RUNNING. THE PACKET GROUP HAS GOTTON A BUNCH
OF THESE BOARDS IN LITTLE ROCK AND ALL HAVE BEEN BROUGHT UP WITH
NO PROBLEMS THEY HAVE EVEN GOT BYE (A REMOTE CP/M PROGRAM) RUNNING
ON PACKET. THE BOARDS ARE MULTILAYER WITH GROUND PLANE AND POWER
"SANDWICH#" IN THE MIDDLE RFI IS AT A MINIMUMN.

IF YOU ARE INTERESTED IN PURCHASING ONE THEY WILL ACCEPT PHONE
ORDERS AND UR VISA/ MC . THE XEROX OUTET STORES NO. IS (214) 960-3367

To: All stations interested in status of Uosat-B
From: Harold Price, NK6K
Sent: 17 FEB 84 17:14:17

All,

The pace is picking up! DCE now 99.9% checked out. Current sense problem fixed, a harness change was required. There was a problem with 1802<-> DCE communications but I now think it was a configuration problem with the s/c multiplexors, i.e. it was working but we couldn't see it at the monitor station.

An extra thermal-vac test was required, but outgassing dropped to 0 after a few hours, so we get the s/c back today (friday) instead of Sunday.

I'll be off the air again until next week sometime, a full report after that.

Subj: UoB Status
Harold,

   I have just sent the following to Larry in response to a number of (unanswered) requests for a status of the UoB project. The status was that we had no time to let anyone know the status - i.e. blind panic!!

Larry,

Sorry for neglecting you all over the past few days, but all hell broke loose!!   We have all been averaging 3 to 4 hours sleep, but excluding waking periods of up to 60 hours in the process.

The DCE has been tested using the harness simulator after the thermal vacuum tests and continues to function perfectly, bar

the memory bit fault which we saw when Harold was here. We could not test the DCE directly during thermal vac. due to a problem decoding data from the receivers and the impossibility of using the umbilical connector to feed the DCE. The 1802 route would have worked if I had spotted the trivial bug in the 'echo' program - too little sleep.

Both comms problems are now resolved, so we should have no problem at Vandenburg. Just one query - Harold increased the delay time on the TRS-80 Mdl 100 to take account of the delay through 2 uarts - does this allow sufficient for the 1802 computer as well?

UoSAT-B and almost all the equipment in our lab has been packed this afternoon for shipping (on the same flight as ourselves) to Washington on Thursday morning. The evening is being spent sorting out all our outstanding correspondence and finding the bits left behind.

We will be releasing more UoSAT-B documentation as soon as possible now, the publication and distribution is set up and the route back will be via Telemail.

Subj: WATER ROCKET REPORT
          USING WATER AS A PRIMARY METHOD OF PROPULSION

            FOR SPACERAFT MODIFYING STANDARD STS ORBITS

Jan A. King W3GEY

V.P. Engineering

The Radio Amateur Satellite Corporation

The Space Shuttle has modified the method by which space-bound payloads enter orbit for the forseeable future. The STS offers the promise of lower payload cost and the ability to carry large payloads into orbit to mention but a few of its primary objectives. For very low cost payloads such as those pioneered by the radio amateur community (the OSCAR series), the Space Shuttle poses, however, a number of severe engineering obstacles which have become major stumbling blocks to the exploitation of this valuable resource. Not unlike most free flying satellites, the communications satellites launched by radio amateurs and used in the Amateur Satellite Service are intended to meet long life objectives. In addition, to meet mission objectives for the communications service to be provided either a geostationary transfer orbit or a sun synchronous polar orbit must be attained by the spacecraft. Unfortunately, neither of these objectives can be met by the standard provisions of a Space Shuttle mission.

STS orbits, typically 296 km in altitude and inclined from 25 to 57 degrees are unstable. A small spacecraft, with a low surface area to mass ratio, will decay from such an orbit in a matter of months. This class of orbits, with a few exceptions, is also unsuitable for communications experiments of interest to the Amateur Satellite Service. It is therefor a necessary requirement for Amateur Satellites and other free flying spacecraft seeking stable orbits to carry a propulsive capability if launched by the Space Shuttle.

Having accepted the burden of a propulsive system as an added spacecraft complexity, yet another problem becomes apparent. Classical propulsion systems employed by satellites are characterized as hazardous devices. Due to the manned presence on board Shuttle safety considerations are necessarily more stringent when using this method of launching a spacecraft. The added complexities and paperwork resulting from the inclusion of hazardous devices on board Shuttle launched satellites conflicts with the low cost nature of these programs and may make such payloads totally impractical or viable only if launched by alternative methods. This problem is exascerbated by the fact that most orbit alternatives can be reached from Shuttle orbits only by multiple delta-V maneuvers. This requires multiple solid rocket engines or a restartable engine on board the satellite, further multiplying the safety hazard problem.

A solution is sought to the "Shuttle Dilema." The Shuttle Dilemma may be defined as follows:

1/ A Shuttle payload is always two burns away from the desired orbital elements when separated from the cargo bay.

2/ The cost of NASA safety approval for a propulsive device used aboard Shuttle by a low cost user is approximately a factor of three higher than the entire cost of the payload itself.

3/ As a rule of thumb, the mass of the paperwork necessary for NASA approval of a hazardous device for a Shuttle flight is greater than or equal to the mass of the payload.

While the above may seem humorous, these statements are all too true and must be dealt with squarely by would-be Shuttle low cost payload designers.

A propulsion system that would solve the Shuttle Dilema could be expected to have the following characteristics:

1/ The propellant used should not be a chemical, pressue or explosive hazard as defined by NASA or the USAF (ref. AFETRM-127-1).

2/ The loading of propellant into the spacecraft should not constitute a hazardous activity. No special safety equipment should be required.

3/ No portion of the propulsion system should contain hazardous devices of any kind. Certain exceptions to this rule might be taken to include category B electro-explosive devices such as pyrotechnically operated valves.

4/ No portion of the propulsion system should be pressurized or become pressurized even remotely while the satellite is on the ground, during powered flight or during astronaut activities in orbit, including those conducted to separate the satellite from the Shuttle.

5/ No portion of the propulsion system should be susceptable to damage due to the environment of the Cargo Bay during powered flight or in orbit prior to or during separation of the satellite.

The Radio Amateur Satellite Corporation (AMSAT), having had practical experience with both liquid and solid propulsion systems on board low cost satellites believes that the above requirements will prove to be virtually mandatory for low cost payloads flown by the Space Transportation System. Two methods have been considered for some time by AMSAT that appear to meet the above five conditions and produce satisfactory performance for space applications. Both involve using water as a fuel and both have been considered by other groups from time to time as methods of space propulsion.

PROPULSION VIA WATER ELECTROLYSIS:

The propulsion of a space vehicle via hydrogen/oxygen fuel produced from the electrolysis of water is far from a novel idea. Hughes Aircraft Company, Space Systems Division documented the results of an internal research and development IR&D project which developed a working model of a water electrolysis rocket during the first half of 1964 (1,2,3,4). Using this technique a single pressure vessle acts as storage for the water and electolyte, as an electrolysis chamber and finally as a pressure bottle for the combined electolyzed gases. The premixed gas may be fed via a single line into the injection chamber of a small rocket engine or thruster. In their final report on this technology Hughes stated, "The Water Electrolysis Rocket has been explored in sufficient depth to verify the feasibility of the concept. Furthermore, it has been determined that this system offers significant advantages over other presently available reaction control systems. Among these advantages are:

1/ Higher specific impulse

2/ Lower system weight

3/ Lower power requirements

4/ Extended life in space

5/ Improved system reliablity

6/ System simplicity "

It is interesting to note that at the time of the writing Hughes did not cosider the safety advantages of the system which are of prime interest to AMSAT. The specific impulse of a small electrolysis motor of the type required for a low cost satellite mission is between 330 and 360 sec. This is considerably better than either an equivalent solid or bipropellant liquid motor system (270 and 305 sec. respectively). Preliminary investigations by AMSAT suggest that the power required to electolyze one kilogram of water is approximately 5,000 WH. This may be related to delta-V for a specific satellite case as shown in Table 1. A minimum system schematic is shown in Figure 1.

It is not known why Hughes did not continue to develope this technology to the point of commercial introduction. Clearly, however, monopropellant hydrazine systems replace other methods for reaction control starting about the same time as the Hughes research on water electrolysis motors. Since this work was done there have been dramatic improvements in both electrolysis electrode and thruster technologies. AMSAT has also conducted

preliminary studies on an advanced method of drying the hydrogen and oxygen gas which should lead to improved thruster performance. This was one problem reported by the Hughes research team.

PROPULSION BY STEAM EXPULSION:

A second method of exploiting water as a safe propellant is by means of a small steam engine integral to the thruster in a water fed propulsion system. Water is allowed to superheat in a small chamber adjacent to an expansion nozzle. Thrust is produced by the acceleration of water molecules as they exit the nozzle. The specific impulse of this technique is far poorer than the electrolysis method (107 sec.), however, the system complexity is very low indeed and the energy required to liberate a kilogram of water into steam is only 750 WH, considerably less than with electrolysis. The specific impulse for a motor of this type can be shown to be governed by the equation:

$$Isp = \sqrt{\frac{2\,C\,K\,Tb\,(1 - \langle Pexit/Pchamb.\rangle^{**}C-1/C)}{(C-1)n\,m}}$$

where:

C = Heat capacity of propellant (water = 1.3)

K = Boltzman Constant = 1.38E-23 J/K

Tb = Gas Temperature = (approx.) 400K

n = molecular weight of propellant (water = 18)

m = mass of a hydorgen atom = 1.66E-27 Kg

Pexit = Nozzle exit plane pressure (assumed = 0.01 Bar)

Pchamb. = Thruster chamber pressure (assumed = 5.0 Bar)

As can be seen, the specific impulse depends inversely on the molecular weight of the fuel used, taken to the 1/2 power. This favors the use of low molecular weight fuels. As can be seen water is nearly optimum for an engine of this type particularly when the other physical properties of this fluid are taken into consideration in a practical system.

While, on balance, a system using steam as a propulsion technique is far from optimum with respect to Isp it is simple enough to be included on even GAS CAN mission and can solve a reasonable

number of propulsion problems for small spacecraft. Figure 1 reviews the performance of this system for a variety of missions of interest to AMSAT and gives a comparison to the electrolysis method.

ORBIT CORRECTION TECHNIQUE USING WATER PROPUSLION METHODS:

A salient characteristic of both propulsion techniques reviewed is that they take electrical energy from the solar arrays of the spacecraft and convery it into potential energy (either in the form of stored gas to be burned or in the form of stored electrical energy). Thrust is best produced in a burst mode rather than with a continuous firing. This is a typical operating mode for a reaction control system (RCS) but is somewhat unusual for an orbit transfer maneuver. In effect, time is traded against the burn duration (power production rate of the satellite) so that a reasonable compromise for the total duration of the propulsion phase of the mission is reached. An important consideration for such a mode of operation is that the total delta-V achieved per day during the maneuver must be greater than the deceleration per day due to drag in the Shuttle base orbit. The orbit transfer strategy for circular orbits with a spinning spacecraft is shown in Figure 2. Two small thrusters at either end of the satellite are employed. Firings always occur at the line of apsidies. Alternate thrusters are used so that a first firing occurs at perigee thus raising apogee and a subsequent firing occurs at apogee now raising perigee. Mini-Hohman transfer maneuvers are repeated until the desired circular altitude is reached. Eliptical orbits can be achieved with a single thruster fired at consecutive perigees thus continuously raising apogee. Inclination changes with this technique are also possible and are most efficiently applied when apogee also coincides with the ascending node of the orbit.

SUMMARY:

The techniques reviewed have been considered in the past by space research projects and by commercial spacecraft manufacturers. While these propulsion technologies have never been reduced to commercial practice, sufficient study has been done to verify their applicability to space missions. If the STS is going to fulfill its mission as a launcher for ALL space interests then some acceptable methods of propulsion must be found for smaller payloads. These methods must take into consideration the low cost nature of such projects and the very stringent safety constraints imposed by NASA on all STS users. In view of the above AMSAT believes that water propulsion technologies should be revisited because they have the potential of solving the "Shuttle Dilema" for a class of users that can bring significant benefit to the space program as a whole.

February 10, 1984

AMSAT has agreed to supply the primary controller for an Space Shuttle Get-Away Special experiment package. The GAS package, with 12 experiments mostly in the Biological sciences, is a community sponsored project in the Texas cities of El Paso and Ysleta.

The experiment is the primary GAS package on STS 41-F, currently scheduled for launch August 9, 1984. This mission will be the second flight for Discovery, the third orbiter in America's shuttle fleet.

The GAS experiment slot was originally obtained by the local Coors Beer distributor in 1977. The experiments are being designed and built by El Paso/Ysleta high school students. Technical advisors have been supplied by the local Gas and Electric companies. Funds and other support have been obtained

from community members.

When the original supplier of the controller backed out of the project, El Paso/Ysleta put out a general call for help. AMSAT accepted the challenge of designing and building the required hardware in the few months remaining. The basic requirements of the controller match the requirements of the PACSAT low power portable ground station controller. A team within AMSAT had already been formed to do that design, and the group had forward momentum built up from work on the Digital Communications Experiment, which will fly as part of the University of Surrey's UOSAT-B satellite on March 1, 1984.

The controller will monitor and record the temperature in each of the 12 experiment compartments. The temperature will be controlled in some areas by switching a heater on and off. Several experiments require movements of an actuator, controlled by a stepper motor.

Although the GAS experiment does not relate directly to amateur radio, AMSAT will gain experience with the shuttle and the GAS program, requirements for the PACSAT project which hopes to deploy from a GAS can in 1986. The controller design will be used for the low power portable PACSAT ground stations required by VITA, co-sponsor of the PACSAT project. Funding for the GAS controller will be supplied by the El Paso/Ysleta group.

The GAS controller will be implemented under the auspices of AMSAT's PACSAT project. Lyle Johnson, WA7GXD, is the group leader for the controller project. Much of the work will be done by Bill Reed, WD0ETZ, manager of PACSAT ground station design, and his group in Dallas. Chuck Green, N0ADI in Tucson will be involved in system design. Harold Price, NK6K will coordinate software activities.

The FCC today abolished the General Radiotelephone Operator's License
(formerly the 2nd class, before the 1st Phone was done away with),
saying that the industry could better regulate those who work on two-way
radio systems. Current holders of the license are to receive a special
lifetime certificate.

b

Greetings

I have a Kenwood TS430s tranceiver which has been giving me troubles almost since I bought it. When I first brought it home, I made the modification to it to allow the 10hz digit to be displayed. This is all that I've done to it. I used it successfully for a month or so, then the problem cropped up: it would only show the 10hz digit (the one specially activated) and no others; furthermore, it wouldn't work. I took it to be repaired under warranty, used it for a couple months more and the same thing has happened again.

The question: has anybody seen this problem? That is, is it just a fluke or is it a known bug? And if the latter, is there a solution?

Yes, the moral of the story is painfully obvious:

> Constitutional Rights do not automatically extend
> to cover new technologies in the United States!

Does this mean that the IRS can confiscate the floppies for my computer without a search warrant? Or in the spirit of this case, that they can require that I surrender the discs to them to be copied? (They are only taking *information*, not material possessions).

If, through some gross miscarriage of justice this case is not thrown out by a higher court, what will happen next? Will the police affix induction coils against telephone lines to pick up the stray signals from the line? After all, how is that morally

different from actually connecting the wires to the line?

I admit that drug dealers belong behind bars, but there are clear precedents for handling open telephone conversations -- after all, telephones were intially all party-lines, right?

I hope I'm not the only one who feels this way. Even if I'm not alone, consider the effect the *perception* that the ham radio community condones such invasions of privacy in the United States will have on international conversations with hams under repressive regimes. After all, for them, they are taking a chance with the lives of both themselves *and* their families when they talk freely. For them, the price of letting one criminal go free will seem to be very cheap.

The air waves are free. In the USA it is always legal to receive a broadcast transmission, though it is not always legal to retransmit it. Be thankful for this; were it not so there could be laws restricting the sale of radio transceivers and laws restricting reception of Radio Moscow. A plaintext

transmission over telephone circuits is never completely secure
anyway -- much telephony uses microwave transmission.

Draw your own morals.

It is misleading to suggest that it is legal to receive ANY and ALL
transmissions. The key is the legal definition of "broadcasting",
which does not have the same meaning as "transmission". For example,
it is illegal to listen to point-to-point telephone microwave
transmissions (it is considered to be wiretapping), and in the last
couple of years prohibitions for NON-point-to-point operations such
as MDS and STV (scrambled) services have been enacted.

Actually, I had had the impression that it was legal to receive
anything you wanted, but there were strong restrictions on what
could be rebroadcast, recorded, or even discussed with individuals
who were not present during the original reception. That is why
I am somewhat confused over the complaints by the HBO et al over
home satellite dishes, Disney Productions over VCR's, etc. So long
as you don't invite the neighborhood over to watch a movie and then
charge admission, I thought it was legal to receive such signals.

But the point about microwave telephone links is more to the topic
of the original discussion. What is the `ethical' distinction
between a radio link between two microwave horns and a radio link
between a handset and a base unit in a cordless telephone. Sure,
the law doesn't cover them yet, but it is undoubtably more an over-
sight than a conscious decision.

I am looking for a copy of an article that appeared in the
June 1976 issue of Ham Radio. The author was Doug DeMaw and
it dealt with solid state oscillator design. I don't have
the exact title or the page nuumbers. If anyone couuld
lend me a copy of the issue or perhaps send me a copy of
the article, I wouuld be forever indebted. Thanks.

CompuScan 2100 Computer Controlled Scanning Radio

The Electra Company of Cumberland, Indiana, announced the new Bearcat CompuScan 2100 computer controlled scanner radio.

This radio scans up to 200 channels in selectable banks, and connects to a home computer (not supplied) via an RS-232 serial port. It will be available with software on 5.25" diskette or tape cassettes for many popular computers. I think the first offering will be for a Commodore 64.

Physically, the scanner is a low profile box with squelch and volume controls, and several connectors. Other controls are computer driven through the RS-232 interface. This scanner looks feature wise like a Bearcat 300, but with a personal computer serving as the control element. Some of the features listed on the data sheet:

+o frequency coverage:
    a. 29-54 (includes part of 10 and all of 6 meter bands)
    b. 118-136 (commercial AM aircraft band)

c. 136-174
d. 421-512

+o audio output: 1.0 watt RMS with internal speaker, 2.0 watts with external speaker

+o antenna: supplied with telescoping antenna, base, and 20 feet of coaxial cable with BNC connectors. (looks like the manufacturer doesn't want the antenna too close to the computer!)

+o sensitivity: 0.6 uv for 12 dB SINAD, all VHF-FM bands, 1.0 uv for 12 dB SINAD, Aircraft and UHF bands.

+o connectors:
a. external power supply
b. external antenna (finally! a female BNC type)
c. RS-232 interface
d. remote control interface

This scanner makes full use of the computer display. The software furnished drives the scanner and a menu interface which allows users to set scanning options, such as:

+o frequencies for up to 200 channels

+o individual channel lockout

+o individual channel delay, which delays the resumption of scanning for a few seconds after a station ends its transmission.

+o up to three nested priority channels

+o up to 4 lines of textual information for each channel, which will be displayed on the CRT when the scanner stops on that channel.

+o automatic search and store, which allows entering of 2 frequency limits, scanning between the two limits, and storing frequencies on which activity was found.

+o a Count register for each channel, to count the number of transmissions detected by the scanner on selected frequencies.

+o 4 auxiliary switches to control external devices, such as a tape recorder or alarm when a signal is received on a designated channel.

One may obtain a specification sheet by calling Bearcat at (317)894-1440.

It's a shame that the frequency coverage does not include the 800 - 1200 MHz bands. A computer controlled scanner may be put to good use in these bands to track trunked radio systems. Coverage of the military aircraft band in the 200 - 400 MHz range and the federal "secret" band in the 400 - 420 MHz range would also be appreciated.

I'd be interested to know if source code and documentation will be supplied so a user could develop truly custom scanning algorithms, rather than using forms-type software to just set options in a rigid, mundane scanning scheme.

Bob Grove, in an article in the January 1983 issue of Monitoring Times, stated that the CompuScan 2100 will scan 12 channels per second, but the search mode is extremely slow, at one increment every 2 seconds! The list price is expected to be near $600.

Interesting topic on monitoring vs. eavesdropping vs. wiretapping, etc.

As far as I know in FCC rules, The Communications Act prohibits divulging
the contents of any communication except those from broadcast stations
and amateur stations. In other words, it is illegal for me to tell you
what I heard on a police scanner, CB radio, marine band, cordless phone,
etc. It is NOT illegal for you to receive transmissions
from a police scanner, marine radio, microwave system, cordless phone
or whatever, as long as you keep it to yourself. This should include
scrambled stuff on TV. As far as I am concerned, anything that
is transmitted on "Broadcast" frequencies by stations licensed for public
broadcasting, belongs to anyone that has the capability to watch/hear it.
My feeling is that services that want to get paid do not belong on standard
broadcast frequencies!

Notice that the FCC purposely has avoided making any decisions on this.

Interesting to note that "ON TV" has hired a detective to locate "illegal"
receiving setups. It was reported in a Chicago paper that they can drive
around and pick up signals from your set to determine what channel you
are watching and if it is channel 44 they will prosecute. I would love
to blanket the area with a signal operating on the local osc frequency
of a TV tuner that would be tuned to that channel.

New Continuous Coverage MX5000 Scanner Announced

Regency Electronics just announced the MX5000 scanner, a 20 channel unit which covers 25 through 550 MHz without gaps. Front panel buttons (on a membrane keyboard) allow selection of FM, WBFM, and AM modes.

The MX5000 has an LCD display and a digital clock. Search increments are selectable: 5, 12.5, and 25 KHz. Front panel switches control keyboard lock and dial lighting. The scanner will be available in February and list for about $600.

The MX5000 unit looks just like the one announced months back from Fanon. Rumor has it that Fanon withdrew it, along with a new continous coverage handheld scanner, that Regency now offers as the HX3000. Sounds like the two are from overseas.

A call to Regency, at (317)545-4281, will get you a data sheet.

With regard to the illegal monitoring question, the issue reduces to:

1. Those who have `illegal' setups regularly quote FCC regulations, i.e. as long as the signals cross my property, and I do not divulge their contents, I may legally view/listen to the signals.

2. The utilities (MDS, satellite movie companies, etc) quote the theft of service laws, i.e. if you are somehow bypassing their rate structure (it really does not matter how), then you are breaking the law.

So please, lets not start a debate over who is correct; many inconclusive wars have already been fought over this question. Let the courts decide.

Rick Spanbauer

SUNY/Stony Brook

ps. I fall into category (1), and believe that if the sender
wants to protect the message contents, it should be
encrypted in such a way that it is not cost effective for
me to decrypt the message.

I am looking for information that will enable me to
make an intelligent decision about purchasing a
sw radio receiver. It must be able to pick up all the
major news services, have an am section good enough
to pull in many of the east coast baseball games and an
fm section. Any help with brand names or availability of
printed information would be great. Thanks for the help.

I am restarting my shortwave listening activity after some 25 years.
But I'm having difficulty finding current DX reports, it seems that
Popular Electronics has changed its name and no longer covers the
SWL front. I have heard of a SWL club (Shortwave Listeners of
North America - or some similar name) but do not have an address
for them.

I would appreciate any pointers to SWL clubs with newsletters, to
stations with a DX report segment, or lists of English language broadcasts
with times, frequencies and station identification.

I am not sure this belongs in net.ham-radio, but I've seen other references
to scanners (public service bands, etc) here.

Thanks in advance, and responses will be summarized for the net.

     With a reduction of price of the Heath HW5400,several
     of us are interested in this rig. Does anyone own one
     or have seen any performance reports?? If so please

post the information or get in touch with me.

Thanks KN9K Rich

Lovely. I remember the local moral mafia (sorry for the insult to the mafia) taking photographs of car license plates at local adult bookstores several years ago. I seem to recall that they then published the tags in the local paper, harassed the owners at work, or some other upstanding and moral activity.

What will happen now? If some station (cable or broadcast) shows a movie/show/documentary which group * doen't like, will * go around in their cars determining who is watching it? I can see it now, with selectors set to the 'Playboy Channel' and the automatic dialers starting prerecorded sermons on sin.

What *are* the laws regarding privacy in the Chicago area? Could that station be hit with a megabuck suit for invasion of privacy? I generally don't like such apparently trivia lawsuits, but this reeks of big brother too much. After all, think of how much you could determine about a person knowing `only' what shows [s]he watched.

Or for that matter, why should you be open to a law suit solely because

your television is tuned to channel 44. Perhaps you enjoy watching encoded
television shows. Like, you know, they're sortta like koans, man!

Next thing you know, typewriters will be contraband (as in most of the
world today).

I saw the Bearcat CompuScan 2100 at Comdex. Unfortunately, my initial
impression was not good. The scanner was connected to a Commodore 64
and every time it found a frequency with something happening, the C64 went
to it's disk to find the appropriate info belonging to that frequency.
The program is written in BASIC (or so the salesperson said) and it was
slow. It would take several seconds to find the info on the disk, by
which time the scanner would have taken off trying to find another
active frequency. Therefore, the display was useless in search mode.
The idea is good however, as happens all to often, the implementation was
lacking. The scanner itself was a nice machine, and the potential with a
fast micro is good. It would probably be better with a micro that had a hard
disk or ram-disk.

PROPAGATION BULLETIN NR 1 FROM ARRL HEADQUARTERS NEWINGTON CT JANUARY 3 1984 TO ALL RADIO AMATEURS

SOLAR ACTIVITY IN DECEMBER WAS SIMILAR TO THAT IN NOVEMBER. THE MONTHLY SOLAR FLUX AVERAGE WAS 93.7...UP LESS THAN ONE UNIT FROM NOVEMBER. BOTH MONTHS SET A PATTERN TYPICAL OF EXPECTATIONS FOR THE COOLER MONTHS OF 1984. THERE WILL BE HIGHER PEAKS AND LOWER VALLEYS AT TIMES BUT THE OVERALL DECLINE WILL BE BARELY NOTICEABLE TO THE CASUAL USER OF THE HF BANDS OTHER THAN 28 MHZ.

IN PRACTICAL TERMS THE DECLINE OF CYCLE 21 HAS MOVED DX CONDITIONS ONE BAND LOWER IN FREQUENCY. THE EFFECT IS MOST NOTICEABLE ON 28 MHZ BUT IT WILL BE SHOWING MORE ON 21 MHZ AS THE SOLAR FLUX AVERAGE MOVES BELOW ABOUT 90. BY CONTAST...WORLDWIDE DX ON 160 AND 80 IS PICKING UP MARKEDLY...A CHANGE NOT WELCOMED BY TRAFFIC HANDLERS WHO LIKE THE SEMI LOCAL CHARACTER OF THESE BANDS DURING THE HIGH SOLAR ACTIVITY YEARS.

FOR EARLY JANUARY WE CAN EXPECT VARIABLE CONDITIONS THROUGH ABOUT THE 12TH...EXCEPT FOR A BRIEF SPELL OF GOOD PROPAGATION AROUND JANUARY 5. A LONGER STRETCH OF GOOD SIGNAL LEVELS AND MINIMIM FADING IS EXPECTED THE 13TH TO 18TH. ABOUT AVERAGE WINTER PROPAGATION IS LIKELY THE 19TH THROUGH 26TH. THE SOLAR FLUX WILL BE LOW ENOUGH IN THE LAST HALF OF THE MONTH TO LIMIT DX ACTIVITY ON 28 MHZ TO THE LOWER LATITUDES AND TRANSEQUATORIAL CIRCUITS MOST OF THE TIME.

AMERICAN SUNSPOT NUMBERS FOR THE PERIOD DECEMBER 22 THROUGH 28 WERE BETWEEN 0 AND 21 WITH A MEAN OF 10.3.

DX BULLETIN NR 1 FROM ARRL HEADQUARTERS NEWINGTON CT
JANUARY 6 1984 TO ALL RADIO AMATEURS

FRANZ JOSEF LAND. UK1PGO...OPERATOR SLAVA...HAS BEEN QUITE ACTIVE ON 40 METER CW BOTH MORNING AND EVENING. REMEMBER THAT AT THIS TIME OF YEAR FRANZ JOSEF LAND IS IN DARKNESS THROUGHOUT THE DAY...MAKING FOR EXCELLENT LOW FREQUENCY CONDITIONS.

LACCADIVES. VU2GDG HAS CONFIRMED THAT HE WILL LEAVE INDIA ON 7 JAN FOR THE LACCADIVE ISLANDS WITH 6 OPERATORS...3 COMPLETE STATIONS AND SPLIT CAPABILITY. THE CALL SIGN MAY BE

VU7WCY...BUT IT IS UNCERTAIN AT PRESENT. QSL TO VU2GDG.

GUYANA. DICK...8R1RBF...IS NOW ACTIVE ON 80 METERS WITH A NEW DIPOLE ANTENNA. WATCH 3795 KHZ AFTER EAST COAST SUNSET.

TUVALU. GORDON...T2GSH...HAS BEEN ACTIVE ALMOST DAILY ON 80 METER SSB BEGINNING AT 1200Z.

CAMBODIA. XU1SS IS A FREQUENT VISITOR TO 20 METER CW AROUND 14015 KHZ. SIGNALS TO NORTH AMERICA ARE STRONGEST FROM 1130 TO 1300Z. QSL WUTH THE OPERATOR VIA JA1HQG.

NIUE. BOB...ZK2RS...RECENTLY HAS BEEN REPORTED ON 40 AND 80 METER SSB AT HIS SUNSET. WATCH 0530 TO 0630 UTC.

IRAQ. YI1BGD HAS A VERY STRONG SIGNAL ON THE LONG PATH TO NORTH AMERICA ON 20 METER SSB. LOOK FOR SAAD ON 14205 AFTER 1100Z.

WESTERN KIRIBATI. T30CT IS REALLY KARL...DL1VU...ON HIS TRANSPACIFIC TRIP. WATCH FOR PLENTY OF LOW BAND CW ACTIVITY FROM THIS AND OTHER SPOTS. QSL AS INSTRUCTED.

DJIBOUTI. BOTH J28DP AND J28DS ARE EXTREMELY ACTIVE ON 40 METER CW FROM 2100 TO 0400Z.

160 METERS. SUPERB CONDITIONS HAVE PREVAILED FOR THE PAST TWO DAYS ON TOP BAND. MANY ASIATIC RUSSIAN STATIONS...AS WELL AS JAPAN...HAVE BEEN WORKED BY NORTH AMERICANS. INTERESTING STATIONS REPORTED INCLUDE EZ6GAW...UF6FHL AND UD6DKW.

SOUTH ORKNEY. THE ARGENTINE EXPEDITION SIGNING AZ5ZA CONTINUES ACTIVE ON 160 THROUGH 10 METER CW AND SSB. THE OPERATION SHOULD CONTINUE UNTIL AT LEAST 17 JAN. QSL VIA LU2A.

ST. MARTIN. FG0HYJ/FS7 IS PRESENTLY ACTIVE FROM THE FRENCH SIDE OF THE ISLAND. JOSE PREFERS CW AND OPERATES HIGH IN THE CW BANDS.

CROZET. FB8WK HAS BEEN REPORTED NIGHTLY ON 80 AND 40 METER CW WITH STRONG SIGNALS IN NORTH AMERICA. WATCH FOR JAN FROM 0030Z ON 80 METERS...SWITCHING TO 40 METERS AROUND 0200Z. QSL TO BOX 190...81200 MAZAMET...FRANCE.

qst de w1aw
hr propagation forecast bulletin nr 2 from arrl headquarters
newington ct january 9, 1984
to all radio amateurs bt

thus far in january, the solar flux has been running lower than for
the corresponding days in december. activity of the earths magnetic
field has also been lower, especially just preceding issuance of this
bulletin. these conditions have made for improved propagation on the
lower amateur frequencies, but they have brought reduced coverage and
fewer hours of dx on 28 mhz, and to some extent on 21 mhz.

active areas presently visible on the sun are in the eastern
quadrant, which would indicate continuance of stable propagation
through about january 10. more geomagnetic activity and degraded
propagation are likely about january 12 and 15, but no serious
disturbances are expected before about the 26th to 29th.

because the solar flux will almost certainly be lower than 124, the
figure used for the prediction charts in december qst, the muf on
most communications circuits will tend to be lower than these charts
indicate.

american sunspot numbers for the period december 29 through january 4
were between 0 and 18 with a mean of 10.3 ar

Since I imagine that a few people might be interested in a answer, I'm posting
this to the net.

The major (only?) magazine for SWLing is Popular Communications, which you
should find in a good magazine shop. Their address is 76 North Broadway,
Hicksville, New York, 11801. It's a pretty good, general interest magazine,
but with some slant to clandestine and survivalist communications.

Several `clubs' publish newletters on a regular basis. The American Shortwave
Listeners Club (ASWLC) publishes a fairly packed newsletter, about 45 pages
worth, covering all aspects of SWLing, and even FM DXing. Their address is

16182 Ballad Lane, Huntington Beach, California, 92649. Of a similar vein, the Society for the Promotion of the Engrossing Enjoyment of DX (SPEEDX) puts out roughly the same number of pages, but is concerned only with SWL, and not Broadcast Band (BCB) and FM too like the ASWLC. Their address is P.O. Box E, Lake Elsinore, California, 92330.

For all BCB DXing, which is easy for anyone to get into, and surprisingly fun, the two major groups which cover BCB only are the National Radio CLub (NRC), and the International Radio Club of America (IRCA). They publish their newsletters, roughly 40 pages each, about 30 times a year, with issues coming weekly in the winter DX months. The NRC publishes `DX News', and their address is P.O. Box 24, Cambridge, Wisconsin, 53523.  The IRCA publishes the `DX Monitor', and their address is P.O. Box 21074, Seattle, Washington, 98111.

For those with a penchant for the out-of-the-way, their is a group which specializes in the frequencies from 150 - 500 KHz, and they are named appropriately the Longwave Club of America (LWCA). Their publication, `The Lowdown', is about 20 to 30 pages a month, and their address is 45 Wildflower Road, Levittown, Pennsylvania, 19057.

All of the clubs also offer various publications and guides to all aspects of the hobby. They all run about $10 to $20 a year to subscribe to.

And, before I forget, the World Radio and TV Handbook (WRTVH) is a bible, and even for the casual listener, it is a boon.

Enough? I hope this helps!

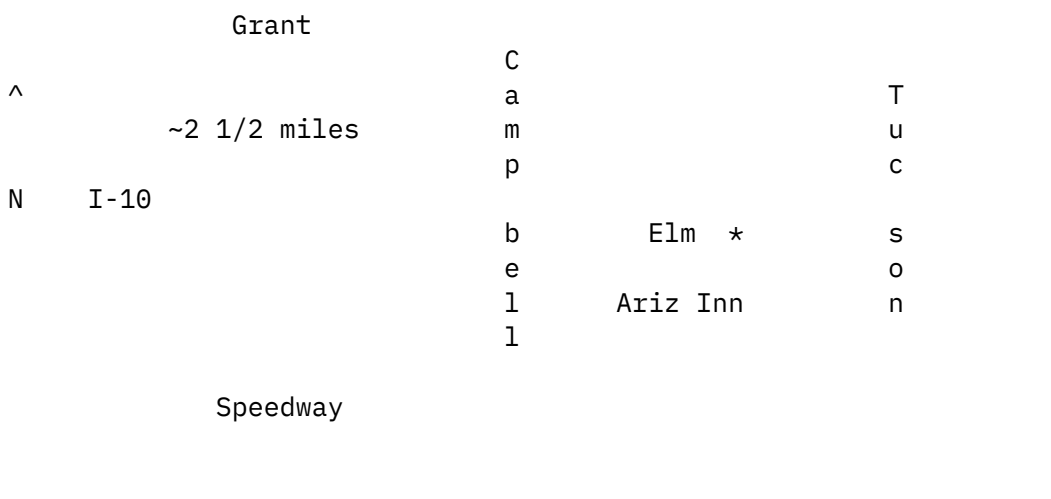
The Tucson Amateur Packet Radio Corporation's annual meeting will be held on Saturday, February 4th, 1984 at the Arizona Inn, located at 2200 East Elm Street in Tucson. See map below for detailed directions to the Arizona Inn.

The meeting will begin at 10 AM and end near 5 PM. Please see the meeting announcement on page 1 of the January PSR for details of the program.

A catered lunch will be provided for those who wish to partake. The cost is $5.00 and includes choice of beverage, salad, a main course of chicken, rice and vegetable, and a dessert.

Due to the limited space available, we request that you fill in the reservation form below and return it to TAPR, PO Box 22888, Tucson AZ 85734 at your earliest convenience. If you wish to have lunch with us, please send a check for $5.00 per person. It is important that we know of your plans by the 28th of January so we can make the appropriate arrangements with the Inn.

We look forward to meeting with you on February 4th!



==========

Name _____

Number in party _____ Number for lunch _____

Please enclose a check or money order for $5.00 per lunch, and

mail to TAPR, PO Box 22888, Tucson, AZ 85734.

Thank you!

phere (much more
during the day then at night).

FM Broadcast is limited to line of sight (actually about 1/3 farther than line of sight) because it is in the VHF portion of the spectrum, where in most cases, signals pass right through the ionosphere without being refracted downward at all.

In the shortwave part of the spectrum, however, signals are refracted back to earth, even bouncing multiple times. This phenomenon varies quite a bit with changes in the earth's magnetic field, the amount of charged particles coming from the sun, and from day to night.

For a shortwave radio (if by major news services you meant BBC, Radio Moscow, etc.) anything but the very lowest quality "all-band" jobs will be fine. Since ionospheric conditions the major factor in whether you will hear a station, and government SW broadcast stations use a lot of power, most shortwave receivers work fine for this. Sony's very small SW receivers are good. If you want to cover everything in the SW spectrum with a top quality receiver and can afford it, an Icom R-70 is hard to beat.

For getting the baseball games on AM, though, there are some problems.

The MW frequencies are noisy, so a very sensitive receiver will still get a lot of static. A good antenna is always important, but an ideal antenna for MW reception would be too big to be practical. One designed like a TV antenna would probably be bigger than a city block. The longest wire you can string up will help bring in any distant AM broadcast stations you can get, though.

Indianapolis Repeater Association Net on 146.70 1-11-84 re-broadcasted a special ARRL Bulletin listing the zone 9 stations that were sorted from the STS tapes and are as follows:

K9VI
N9GA
K9HMB
WB9MSB
WB9C??

Congradulations to those stations although few. I beleive that the 9 zone stations being in the middle of the country were working against great odds. The coastal stations had first contact as he broke the horizon and the maximum QRM would most likely occur at mid orbit and those at the Canadian border may have had the best "last" shot.

It was fun and we did hear him loud and clear and better luck the next time (which we hope is soon) is all we can ask for.

The FCC requires operators of radio transmitters to operate on certain
radio frequencies, and to keep their transmitter outputs within those
frequency bands. Unfortunately, it costs GREEN STAMPS to provide RF
shielding, so many manufacturers of consumer electronics skimp on this
shielding. Therefore, even a clean transmitter will interfere with
this equimpent. If the transmitter is operating on its proper frequency,
it is the responsibility of the user of the receiving equipment to clear

up the problem. Often, a local ham can help you install shielding to solve the problem. However, RFI problems can sometimes be tough to solve and may require quite a bit of perserverance.
[I'm also posting this to net.ham-radio to give my fellow hams notice that this discussion is going on on net.audio]

I remember coming across an article (I think in *Newsweek*) shortly after the imposition of martial law in Poland that Poland required samples of a typewriter's output (i.e. aAbBcCdD...) be submitted to the state police, that all typewriters be registered with the state police, and that the penalty for an unregistered typewriter was something pretty extreme, like 10-20 years at hard labor. This article was consistent with several other things I had come across earlier, primarily with regard to the Soviet Union, but references elude me. In most of the rest of the world, of course, the question is somewhat academic as there is effectively no one who has the resources to obtain a typewriter, the knowledge to use it (I'm ducking now on that one, I can see comments coming already), and the desire to oppose the government. (I.e. bite the hand that feeds them).

Perhaps they are not contraband in the sense that possession is illegal, period; but I have the distinct impression that they are definitely `controlled substances' in every socialist, authoritarian, or [whatever the other type is] country.

Food for thought: I was looking through the Code of Federal Regulations a while back and it appears that the government has the authority to confiscate every ham radio in the country if it wants to. It was some-
where near the front of the section on the Amateur Radio Service, and

I may have just misread it, but you may want to check it out. After all,
in a very real sense there is no difference between confiscating
typewriters because they can be used to criticize the government and
confiscating ham radios because they are an uncontrolled communications
resource.

Concerning MW listening: A loop antenna with amplifier is often
the best bet. Another good alternative is an active antenna
(uses a short whip) mounted in the clear, well away from power lines
et al., with the mast well grounded. Then again, maybe you are lucky
and live where the power lines are clean and the neighbors don't
use light dimmers. Then fifty feet of wire strung into a tree will
do great!

A summary of the SWL DX information I received to date follows:

PUBLISHERS ----------

CRB Research; PO Box 56; Commack, NY 11725
"The Top Secret Registry of US Government Radio Frequencies," 5th edition, about $15; "Rail-Scan," "Air-Scan," "Confidential Frequency List."

Centry Print Shop; 6059 Essex Street; Riverside, CA 92504
"World Radio-TV Handbook (WRTH)," $15 UPS, $16 1st class mail; schedule and club listings, receiver reviews.

PROGRAMS ----------

Radio Canada SWL Digest
Sat 2130GMT 17875, 17820, 15325, 15150, 11945 kHz,
Sun 1930GMT 17875, 15325, 11905 kHz (abbrevuated version),
Sun 2330GMT 11895, 9755 kHz,
Mon 0300GMT 9755, 5960 kHz
Tue 1920GMT 17820, 15260 kHz.

MAGAZINES ----------

"Monitoring Times;" Grove Enterprises; (704) 837-2216; $10.50/year.

"Popular Communications;" 76 North Broadway; Hicksville, NY 11801; general interest with clandestine and survivalist coverage.

"Review of International Broadcasting;" Glenn Hauser; PO Box 6287; Knoxville, TN 37914; $15/year, $1.25 sample; program content, schedules, equipment.

DEALERS ----------

Gilfer Associates; Park Ridge, NJ (201) 391-7887
CRB books, WRTH, customized general coverage receivers, other hardware.

CLUBS ----------

American Shortwave Listeners Club (ASWLC); 16182 Ballad Lane;
Huntington Beach, CA 92649; bulletin 45 pages covering SWL and FM DX.

Association of North American Radio Clubs (ANARC); 1500 Bunbury Drive;
Whittier, CA 90601; $5/year, $0.75+SASE sample, $0.50+SASE club list;
newsletter with club and equipment news.

International Radio Club of America (IRCA); PO Box 21074; Seattle, WA 98111;
DX Monitor bulletin; "DX Monitor" bulletin covers broadcast band DX only.

Longwave Club of America (LWCA); 45 Wildflower Road; Levittown, PA 19057;
"The Lowdown" bulletin specializes in 150 - 500 kHz.

NASWA; PO Box 13; Liberty, IN 47353; $16/year, $1 sample; "FRENDX" bulletin,
SW BC station logs, extensive schedule and station info.

National Radio Club; PO Box 24; Cambridge, WI 53523; "DX News" bulletin covers
broadcast band DXing only

Society for the Promotion of the Engrossing Enjoyment of DX (SPEEDX);
PO Box E; Lake Elsinore, CA 92330; $18/year, $1 sample; bulletin w/ logs
(especially utility stations), some schedule and program info.

I can tell one place where TV detectives come to your door and threaten
prsecution - thats England!. Over there you have to pay a licence fee per
household to operate at TV - thats what finances the BBC and makes it
independant of Government handouts and commercials - say 10 million
housholds paying around $75 per year brings in enough to run 2 TV channels
4 national radio channels and many local stations. Of course there are lots
of people who would like to get away without paying so the Post Office, whose

job it is to collect and administer the licence scheme has for years had detector vans of increasing sophistication to detect unlicensed users. They have it to a fine art where they can tell what channel you are watching and what corner of the room the TV is in!. 1984 came a long time ago in Britain as far as TV is concerned!.

x

At a local chapter meeting of the Radio Communications Monitoring Association (RCMA), a club officer announced that Canadian members were not receiving the club newsletters. The newsletters are being confiscated by the postal authorities because they contain frequency information for radio systems for the Royal Canadian Mounted Police (RCMP), airport security, etc.

A letter in the January 1984 issue of Monitoring Times, another publication which includes frequency listings, claims that this magazine is being confiscated in Canada also.

Subj: 1984 Vintage Orbital Elements in BASIC

Here follow the most recent compilation of 1984 vintage orbital
elements direct from NASA (except for AO-10, where Millstone Hill
values are included). These are already in the format for inclusion
directly in the infamous 'IWI program. Sorry, but no suitable data
for RS-3 or RS-5 has yet been received. The 203xx and 205xx blocks
of data will be posted when it becomes available. 73, Tom

Hint for Finding Nearby Transmitters

There's been discussion about neighborhood transmitters interfering with TV's and stereo equipment. Here's a tip for finding a radio transmitter operating close by:

Connect a frequency counter1 to an outside antenna!

One of my scanners was being overloaded by a nearby transmitter. I didn't know anything about the type or location of this transmitter, but was determined to find out.

By connecting my 520 MHz frequency counter to an outdoor 2 meter antenna, I was able to determine the station's fre-

quency. The strong signals were coming from another radio amateur that was operating his own 147 MHz repeater in an apartment about 500 feet away from me!

His signal was so strong, that my counter indicated a stable frequency reading with a 19" wire antenna plugged directly into the counter!

---

1. Insensitive frequency counters may require the use of a broadband preamplifier between the counter input and the antenna.

QST DE K9EUI
DX BULLETIN NR 2 FROM ARRL HEADQUARTERS NEWINGTON CT
JANUARY 13 1984 TO ALL RADIO AMATEURS

JUAN FERNANDEZ. CE0EVG/0Z, RUDY, IS ACTIVE ON 14210 KHZ BETWEEN 0300 AND 0500Z. QSL VIA WB6WOD.

SYRIA. YK1AO, OMAR, HAS BEEN ACTIVE ON 14202 KHZ, GIVING OUT CW CONTACTS ON REQUEST. QSL DIRECT.

LLOYD AND IRIS. 4T4WCY ACTIVITY IS BEING WRAPPED UP, AND THEY PLAN TO GO NEXT TO BOLIVIA. QSL VIA YASME.

LIECHTENSTEIN. DL7NS/HB0 CONTINUES TO BE ACTIVE ON 80 THROUGH 10 METERS.

UPPER VOLTA. XT2AU, ANNO, HAS BEEN WORKED ON 21335 KHZ AT 1600Z. QSL TO WA1ZEZ.

DODECANESE. SV1OL/SV5 IS ACTIVE ON 21025 KHZ AT 1300 TO 1400Z. QSL TO GEORGE, SV1NA, WHO IS BELIEVED TO BE THE OPERATOR.

ZAMBIA. 9J2JH, JACK, HAS BEEN ACTIVE ON 21265 KHZ AT ABOUT 1900Z. QSL DIRECT.

JORDAN. JY9CZ HAS BEEN ACTIVE ON 21021 KHZ FROM 1200 TO 1300Z. QSL VIA THE BUREAU.

160 METERS. NEW CALL SIGNS HEARD ON 160 METERS INCLUDE 5B4PW, SV1IW AND SV1JG. ALSO ACTIVE STATIONS INCLUDE JX5DW, OH0BH, UF6FHC AND MANY OTHER RUSSIANS, AS WELL AS 4X4NJ AND 4Z4DX.

LACCADIVES. A GROUP OF OPERATORS ARRIVED ON THE LACCADIVES ON JANUARY 8 AND ARE EXPECTED TO STAY FOR ABOUT TEN DAYS. THEY ARE ACTIVE ON 80 THROUGH 10 METERS. THEY HAVE BEEN WORKING NORTH AMERICA ON 20 METERS FROM 1230 TO 1700Z, FIRST LONG PATH, THEN SHORT. TRANSMITTING FREQUENCIES USED HAVE BEEN 14025 KHZ CW AND 14145, 14180 AND 14190 KHZ SSB. THEY HAVE ALSO BEEN WORKED BY NORTH AMERICAN STATIONS ON 40 METER CW FROM 1830 TO 0200Z. THEY HAVE BEEN TRANSMITTING ON 7002 AND 7005 KHZ. QSL TO VU2GDG.

COCOS ISLAND. NINE OPERATORS PLAN TO BE ACTIVE FROM COCOS BETWEEN 1800Z JANUARY 14 AND 2000Z ON THE 20TH, OPERATING SSB AND CW ON 160 THROUGH 10 METERS. OPERATION WILL BE ON 10, 15 AND 20 METERS FROM 1200Z TO 0000Z. THE 10 METER STATION WILL MOVE TO 40 METERS AT 0000Z AND A FOURTH STATION WILL BE ON 80 METERS. 160 METER CONTACTS WILL BE AVAILABLE ON SCHEDULE. QSL VIA TI2CF.

QST DE K9EUI
PROPAGATION BULLETIN NR 3 FROM ARRL HEADQUARTERS NEWINGTON CT
JANUARY 16 1984 TO ALL RADIO AMATEURS

BEGINNING JANUARY 6,THE SOLAR FLUX ROSE GRADUALLY,REACHING A HIGH OF 106 ON THE 13TH. IT WAS DROPPING BACK AS THIS BULLETIN WAS ISSUED AND THE DOWNTREND IS EXPECTED TO CONTINUE THROUGH THE 19TH. THERE WILL BE ONLY A SLIGHT RISE THEREAFTER UNTIL THE END OF JANUARY.

WE HAVE BEEN IN A RELATIVE PERIOD OF SOLAR CALM FOR ABOUT TEN DAYS IN WHICH THE MUF HAS BEEN LOW, BUT PROPAGATION HAS BEEN GENERALLY GOOD OTHERWISE. JANUARY HAS BEEN TYPICAL OF WHAT CAN BE EXPECTED FOR THE NEXT SIX WEEKS OR SO. PROPAGATION CHANGES WILL BE MORE THE RESULT OF THE SUN'S MOVE NORTHWARD THAN OF ANY MAJOR CHANGES IN SUNSPOT ACTIVITY.

FOR THE FORECAST WEEK, THERE WILL BE INCREASING GEOMAGNETIC ACTIVITY, WHICH WILL DEGRADE HIGH LATITUDE CIRCUITS MAINLY. TRANSEQUATORIAL AND OTHER LOW LATITUDE PATHS WILL BE MOSTLY GOOD. NO SERIOUS DISTURBANCES ARE EXPECTED BEFORE THE LAST FEW DAYS OF JANUARY.

SOLAR FLUX NUMBERS ARE LIKELY TO BE ON THE LOW SIDE FOR THE SAME PERIOD. THE NORTH ATLANTIC PATH WILL CONTINUE TO BE THE MOST VARIABLE, PARTICULARLY ON 21 AND 28 MHZ. THE LATTER BAND WILL BE USEFUL MAINLY IN THE LOW LATITUDES AND THE TRANSEQUATORIAL PATHS.

AMERICAN SUNSPOT NUMBERS FOR JANUARY 5 THROUGH 11 WERE BETWEEN 20 AND 46, WITH A MEAN OF 33.4.

qst de ad7i
hr propagation bulletin nr 3
newington ct january 16, 1984
to all radio amateurs bt

beginning january 6, the solar flux rose gradually, reaching a high
of 106 on the 13th. it was dropping back as this bulletin was
issued, and the downtrend is expected to continue through the 19th.
there will be only a slight rise thereafter until the end of january.

we have been in a relative period of solar calm for about ten days in
which the muf has been low, but propagation has been generally good
otherwise. january has been typical of what can be expected for the
next six weeks or so. propagation changes will be more the result of
the suns move northward than of any major changes in sunspot
activity.

for the forecast week, there will be increasing geomagnetic activity,
which will degrade high latitude circuits mainly. transequatorial
and other low latitude paths will be mostly good. no serious
disturbances are expected before the last few days of january.

solar flux numbers are likely to be on the low side for the same
period. the north atlantic path will continue to be the most
variable, particularly on 21 and 28 mhz. the latter band will be
useful mainly in the low latitudes and the transequatorial paths.

american sunspot numbers for january 5 through 11 were between 20 and
46, with a mean of 33.4 ar

Concerning the recent mention of a detective searching for illegal viewers of channel 44, has anyone ever heard of any cases of this "TV detective" actually coming to someone's door and threatening prosecution? It seems to me that the viewer need never admit that he/she was watching channel 44 (or whatever), and that the detective could never prove beyond a reasonable doubt to a court of law that someone had been illegally watching channel 44 without entering the house (violation of constitutional rights of privacy), which a private detective has absolutely no authority to do. I would assume that the detective depends on scaring the viewer into admitting verbally that he/she was watching illegally, and would use this verbal confession to support any court case.

I was also intrigued by the statement made by Bruce Giles that typewriters are contraband in most of the world. Is this true? Could you elaborate, Bruce?

Is there any sort of "UNIX discussion net" on the air in the Northern New Jersey or NYC area, perhaps on a 2-meter or 220 repeater? If so, I would love to participate. If not, anyone interested in starting one?

Doesn't the cable companies' own argument apply to them in this case?

They are running around monitoring radio signals with information not intended for their use. It is OK for them to receive these signals but it should not be OK for them to make use of the information they obtain from such eavesdropping -- just as the eavesdroppers on other radio broadcasts may not sell them or use them for financial gain.

Just when you thought the discussion of listening in on cordless telephones was over:

While looking through an old issue of Popular Communications, I found the following text in the Letters to the Editor column, page 12, in the October 1982 issue.

A Pop Com reader asks:

"You mentioned listening in on cordless phones in the September issue of Popular Communications. That made me wonder if this constitutes wiretapping. How about discussing listening in on cordless phone conversations?"

Tom Kneitel, the Editor responds:

"....It doesn't require any direct wire connection to monitor them so it can't be considered wiretapping. However, since these units aren't FCC licensed (they operate under Part 15 regulations), they may well not be covered under the secrecy of communications provisions (Section 605) of the Communications Act...."

STS-9 was seen over indianapolis Thursday evening, and was shadowed
by the sun at 6:27:30 EST. I suspect that it will be visible this
evening (Friday), and most of the ham operators here will be listening
for the orbit 70d, 605 to 625pm EST. Part of this orbit should be
visible, given clear skys!

Fantastic!! This is only two seconds early compared to my predictions
based on a NORAD element set from earlier in the day. This is easily
explained by the effects of the atmosphere, etc.

When I compute further sightings, I'll post them.

Phil

Note that the epoch time is just before an ascending node; hence the
orbit number is still 65, but changes to 66 just a few seconds after
epoch.

Finally... heard during the 8:30am EST pass over the east coast. Brief
transmissions, good signals, very clean audio. As usual, plenty of lids
and self-appointed policemen.

w5lfl heard in North Carolina 5 DEC, 8:28 am calling CQ North America, will listen for 5 seconds. Signal was a little weak to my mobile rig. The scheds I had did not list this pass for operation, so I heard him mostly through luck. Heard three transmissions but did not hear any calls read back.

W5LFL was heard with a very strong signal at 10:08:15EST and 10:10 EST
in central indiana Sunday Morning. He seemed to not follow the format
prescribed where he was to transmit for an entire minute. He transmitted
quickly, and then allowed more than the allotted minute for ground
stations to contact him. He gave a brief account of the view from the
spacecraft, as it crossed from Houston up over the Great lakes, and
acknowledged only one call, but he was not sure of the exact call, indicating
that he would retrieve it from the tape when he was on the ground. At any
rate, the best chance of working W5LFL seems to be a matter of getting on his
tape, in other words, don't worry if you dont hear him acknowledge your call!

On other matters, anyone volunteer to decipher the tape he is making!! What
a job that will be, especially if a intense effort is made to pull all the calls
out of the tape, rather than just the obvious ones. I guess they will be listed
in some form or another in the future.

W5LFL was reported , by W5RRR and others, to have worked JY1, King Hussein of
Jordan, on the same orbit referred to above, as the shuttle descended over
Europe and Asia. In fact, local repeater chatter indicated that perhaps a
qso occurred, not just a one way "I heard JY1" by W5LFL.

I am looking to buy myself a new rig for low-band work. Currently I have
a Heath HW-8 QRPp rig, but I live in an apartment and just can't seem to
get a signal out. I'd like to keep expenses to around $600-$700, and CW
performance is of paramount concern. In fact, lower priced CW only rigs
would be ok, if such creatures exist. Any ideas and suggestions?

A number of you have written asking for information about orbital
elements, tracking programs, etc.

A description of the meaning of each orbital element appears in the
current (December, 1983) issue of QST in Bernie Glassmeyer's Amateur
Satellite Program News column.  This is an excerpt from a longer article
(with some explanatory diagrams) that I wrote which appears in the current
issue of Orbit Magazine (the AMSAT publication).

A wide variety of turnkey programs all adapted from W3IWI's BASIC
tracking program (Orbit Magazine #6) are available for nominal donations
(~$15/copy) from the AMSAT Software Exchange, PO Box 27, Washington, DC
20044.  Be sure to include an SASE with your request for information.
Versions are available for such small computers as the Timex Sinclair 1000,
Commodore C64, CP/M, etc.

I have a fairly comprehensive Unix software package for satellite
```

tracking that maintains an updated display (using curses) of satellite
position, tracking station az/el, AOS/LOS times, etc. This is available
for a small magtape and SASE.

Is W5LFL planning to operate during the extra day in the STS9 mission?
A recent news article says that orbit 144 will pass over Boston.

Can anybody send me the scheduled times for passes over the East Coast
or his operating schedule?

By the way - I heard him on my scanner radio last Sunday morning.
His signal was clear and crisp.

This weekend is the weekend of the ARRL 10 meter contest. The point structure has been changed to promote cw activity, and also to promote novice/technician interest. an outline of the rules follow:

Starts 0000z saturday, 12/10/83 Ends 2400z sunday, 12/11

exchange signal report and state/province dx stations exchange signal report and serial number.

points: phone qso 2 points, cw qso 4 points, novice/tech in the 28.1 to 28.2 mhz band (signing /N or /T) 8 POINTS!!!

Unless someone is going for the score, this should be enough info to get on and participate. Note that the incentive is there for contesters to be in the novice band....REMEMBER TO take the linear off line in this band because of the reduced power limit of 200watts in the novice band!...and hopefully some of the /N's and /T's out there will try their hand at contesting, as its a good way to help your dxcc totals, and was totals..and you will be helping out the heavyweight contesters also...

good luck, Steve Wheatley, KU9C, inuxc!wheatley

According to the ARRL information line, the following orbits are
scheduled for W5LFL operation for today (Tuesday):

Orbit   Time

129A 9:29 AM   [note- I heard him on during this orbit -KA9Q]
130A 11:10AM
132D 2:00 PM
133D 3:44 PM
134D 5:18 PM
135D 6:45 PM

No details of his Wednesday operations have been released yet.

Phil

As part of the design effort for the PACSAT store-and-forward satellite,
I would like to gather as much information as possible about all
non-amateur users of the 420-450 mhz amateur band, in North America
and elsewhere. Since it is currently planned to use this band
(specifically the 435-438 mhz subband allocated to the Amateur Satellite
Service) for the digital uplinks to PACSAT, I particularly need to know if
interference from ground radar systems (e.g., Pave Paws) is likely to be
a problem.

In the past, amateur satellite transponders have used simple pulse
blankers to suppress any radar interference, which has worked well with
SSB and low rate data. However, PACSAT will carry PSK demodulators
running at bit rates on the order of 9600 bps. At such speeds I suspect
that there might be radars with pulse durations greater than one bit
time.

Specifically, I would like to know:

Locations
Frequencies in use
Pulse shapes, durations and repetition rates

Occupied bandwidth
Peak power levels
Antenna patterns
Operating schedules (24 hrs/day, etc)

Thanks,
Phil Karn, KA9Q

W5LFL on the shuttle "came in" very strong tonight. He did seem to be
further east than expected.   A lot of hams (sigh) did not seem to know
better than to call him on his downlink frequency.

qst de ad7i
hr arrl bulletin nr 118r5 from arrl headquarters
newington ct december 5, 1983
to all radio amateurs bt

nasa has announced more details of w5lfls operating schedule. these are the orbits, acquisition of signal, loss of signal and area covered.

in the table, the orbit number is followed by an a or d. a is fo ascending and d is for descending. the time, d, days, h, hours, and m, minutes, is expressed in mission elapsed time, met, and can be calculated by adding this amount of time to your actual local launch time.

orbit	aos met			los met			area
	d	h	m	d	h	m	
119d	7	08	07	7	08	20	western u.s.
125a	7	16	42	7	16	50	spain and europe
126a	7	18	17	7	18	24	europe
126d	7	18	52	7	19	w	australia
129a	7	22	29	7	22	50	central u.s.
130a	8	00	10	8	00	20	western u.s.
132d	8	03	00	8	03	12	canada
133d	8	04	44	8	05	06	northeastern u.s.
134d	8	06	18	8	06	48	central u.s.
135d	8	07	4	8	08	07	western u.s.

of the above orbits, the best opportunities to contact w5lfl are orbits 119, 126, 129 and 130. these represent orbits during which his antenna will be oriented toward the earth. during other orbits his antenna will be pointed toward the stars. w5lfl will be listening, but two way communication may not be possible ar

qst de ad7i
hr propagation forecast bulletin nr 49 from arrl headquarters
newington ct december 5, 1983
to all radio amateurs bt

looking back at the first seven years of solar cycle 21 shows that the sun was active for a much longer period than earlier predictions had indicated. it also hit much higher peaks than all but two previous solar cycles for which reliable records are available. it is obvious that the pendulum has now swung the other way. the solar flux high for november was only 111 and the low was 80. the monthly average was 93. all three figures are the lowest recorded since august, 1977.

what these figures mean in terms of propagation on our dx bands is shown clearly by conditions observed in the past week or so. nov. 28 to dec. 1 was mostly below average. dec. 2 to 4 was a period typical of quite favorable conditions, with the solar flux in the 90s and the k index consistently below 2. propagation in the northern hemisphere should be mostly between these two extremes during the colder months of 1984, at least.

for the immediate future, dec. 5 to 16 will be mostly below normal. december 17 through 24 will be mostly above normal, with the muf depending on the solar flux level in this period. the flux is currently lower than the base figures used for the propagation charts in qst for november and december, so these charts will tend to be on the optimistic side.

american sunspot numbers for november 24 through 30 were between 0 and 16 with a mean of 6.0 ar

Satellite: sts-9
Catalog number: 14523
Epoch time: 83341.54513838
   Wed Dec 7 13:04:59.956 1983 UTC
Element set: MH 12-7-83
Inclination: 57.0140 deg
RA of node: 164.9430 deg
Eccentricity: 0.0005229
Arg of perigee: 326.0820 deg
Mean anomaly: 97.8970 deg
Mean motion: 16.13365400 rev/day
Decay rate: 0.0051403 rev/day^2
Epoch rev: 143
Semi major axis: 6615.400 km
Anom period: 89.254424 min
Apogee: 245.399 km
Perigee: 238.481 km
Beacon: 145.5500 mhz

This thing is coming down so fast that if they just waited for a few
days, they wouldn't have to fire retrorockets! MH 12-7-83 AOS/LOS times
for the last pass this morning showed a 45 second discrepancy with
respect to MH 12-5-83, a set only two days old, and in fact I noticed
this in my tracking of W5LFL.

With each new set, the updated times show the orbiter to be running
early with respect to each old set; this means that the drag factors
must be consistently too small.

Subj: W5LFL full quieting.
Reports from other stations in the Duluth, MN area indicate
that Owen was operating orbits 129 and 130 this morning with
good signals into the area.

I have excellent full quieting recordings of him on orbit 134
as he passed over mid-Montana.   On that pass, he acknowledged
WA7DPM, N7ARE (on CW, yet!) and W5FFM.

Apparently, DPM was broadcasting on several channels, since
Owen commented on how he 'certainly covered the spectrum'.

Signal levels into a 12 db RHCP yagi and TS-700 were running
as high as S9 +20 db.

Everyone who has heard W5LFL has remarked about his strong signal strength. Those who are familiar with satellite link calculations are not suprised; they are familiar with what can be done when you don't have the earth standing in your way!

Here's a rough calculation to give you an idea of what to expect. W5LFL is running 4 watts out to an antenna with a gain (lets be charitable) of 0 db. Lets also assume you have a 0 db gain antenna on the ground (most verticals have 5-6 db over this, while HT rubber duckies may have a gain of -1 or -2 db, this info coming from memory and not from any authoritative reference). Of course, these numbers are affected by lots of things, so they are only approximations.

At the horizon, the straight-line range to the shuttle, flying at an altitude of 250 km, is about 1800 km. The path loss is approximately equal to

22 + 20 * log10(distance in wavelengths)

For 1800 km on 2 meters, this is about 141 db. Directly overhead (250 km), this is reduced to 124 db. For a transmit power of 4 watts, which is equivalent to +6 dbW (6 decibels over 1 watt), received signal strengths in omni antennas would be -135 and -118 dbW, respectively. This translates into levels of 1.3 and 8.9 microvolts into 50 ohms: capable of full-quieting signals into almost any modern 2m transceiver.

Remember also that the link is reciprocal: if you can hear him when he runs 4 watts, he could also theoretically hear YOU running only 4 watts. Of course with the pileups he hears nothing but QRM unless one station is at least several db stronger than all the others, which naturally leads to an all-out power war.

A friend of mine has several years of QST back issued he'd like to
donate to a worthy cause. They date back to before 1960. If you know of
a charitable organization that would be interested in having them
please let me know - by mail - and I'll forward the information on
to him.

Radio shack has this little back-of-set antenna for CB's (sorry about the curse word...). It is about a foot or so high and has a 90 degree construction, so you just plug it in to turn the set into a portable. It sells for $ 8.95.

Questions for the net:
1) Can it be used for 2m, or will the center loading coil make it

impossible to match to 144 MHz ? Anybody try this particular antenna ?
2) Does anybody in the ham world make such antennas, for any band ?
3) How about homebrew ? Does anybody know of articles for back-of-rig portable antennas, especially 2m ?

My intended application is for travel. I do not have an HT, but would like to be able to carry my rig with me on trips, and be able to set up anywhere (hotel rooms, etc.). My suitcase will fit my rig and a small power supply, but Ringo Rangers or Butternut Verticals are obviously out of the question.

FCC Shuts Down Another Pirate Radio Station

The following excerpt is from the Pirates Den column in the December 1983 issue of Popular Communications magazine:

> The letters WRAM comprise the self-proclaimed callsign of a shortwave pirate broadcaster ... "RAM Radio" was famous in SWL circles for their marathon transmissions, and were widely heard on their frequency of 7430 KHz.
>
> Perhaps WRAM was on once too often and heard by one SWL too many. The station was closed recently

by Enice C.
Coleman from the Federal Communications Commission's office in Oxford Valley, PA. I had a chance to talk to the operator, Ron, about the closer [sic]. He admits that WRAM's twenty hour broadcasts may have had something to do with Mr. Coleman's ability to track down the station.

"I just had it on too long," says Ron, referring to his transmitter. "I just left it on - it was in my room. I kept on switching tapes and had announcements."

Another underlying cause was the television interference (TVI) that Ron's neighbors were receiving from WRAM. Evidentally [sic], complaints were received by the FCC regarding this interference....

When Coleman knocked on Ron's door and identified himself as an agent from the FCC, Ron knew the game was over and invited him inside. "I figured ... that if I gave them any trouble, they'd be back in five minutes with a warrant anyway" he says.

One of Ron's first thoughts when he saw the agents was one of disappointment. "I was having a lot of fun with my broadcasts and they ruined it!" he says with a chuckle. His thoughts then became a bit more serious as he realized there was a possibility that the vintage radio equipment he owned might be confiscated. "I thought they were gonna take my stuff!" he said.

WRAM was still on the air when Coleman arrived, and Ron was told to inform his listeners that the station had been closed down by the FCC.

Ron is not exactly sure what penalties will be levied against him for broadcasting without a license, but Mr. Coleman has hinted that a fine somewhere in the range of $750.00 could be expected...

Those with some experience in the VHF/UHF end of the Service
saw this fiasco building from quite a ways back down the road. There are
no surprises here; I went through the dress rehersal about 10 years ago.

At that time I was trustee for the "first" 2 meter repeater in my
area. It was the beginning of an era of transition. Prior to 1973
those who wanted to play around with Amateur "repeaters" bought up
surplus "highband" taxicab radios, rextaled and retuned them, and
put them on the air. To be fair, most hams usually watched as a
more experienced friend tuned and installed their first working
2 meter FM radio, but by their time their 3rd or 4th radio went into
service, most were capable of "doing it themselves". For $25-50
invested in an old boat-anchor, $15 in a set of crystals, occasional
maintainance work and some luck, we all were "talking on the radio".
The price of admission was the willingness to work and to learn.

Then, of course, the "10 watt wonders" arrived from the land of the
rising sun. We called them "Riceboxes" or "JapTracs" (appologies to
Motorola). Quickly enough the price of admission became the ability
to write a check; no knowledge required.

"Never mind", said the check-writers, "that we don't really understand
how our equipment works.....we are 'communicators', not engineers.
We will provide the corps of 'trained operators' to meet any
communications need".

It also happened, at that time, that the repeater group took on a
committment to provide emergency communications for a local public service
agency, principally during the frequent brush fires that occur
during the late Fall. I served, for a while, as coordinator of
this activity, and I had numerous occasions to activate the emergency
net. It was, as they say, a "learning experience".

I found, while running this *directed & disciplined net*----much to my surprise----that the sub-set of the local operators who caught on to the idea of net discipline and precision communications were (GENERALLY) the "technical types", the very ones who were constantly building and tearing through the latest "boat anchor" they could locate. The 'communicators' were (GENERALLY) complete busts at their 'speciality'. They could waste more precious net time with their superfluous blabberings and their inability to adapt to any "out of the ordinary" demands.

Time progressed and the technical types slowly abandoned 2 meters as the numbers and influence of the pure "communicators" grew. As a consequence, the average level of technical understanding on the band began a gradual, continuing decline.

I (and others) no longer operate on 2 meters, and I have no interest in returning to that band. But I am in no way surprised by the idiotic foulups that occured during the flight of the Columbia..

FLAME ON

****

How much (expletives deleted) "technical ability" does it really take to read and digest the operating schedules (published endlessly) for Columbia in advance? To grasp the idea of a "communications protocol"? To understand what the front panel controls on a simple 2 meter radio do, and how to conform them to that protocol (it's unrealistic to expect today's "ham" to understand how the components behind the front pannel behave, but must he be ignorant of the frontside controls as well)?

WHAT A DISGRACE THIS ENTIRE EPISODE HAS BECOME!
What a disgrace to our Service, which went before the news media, both local and national, and presented a picture of belligerent incompetence! What a disgrace for W5LFL, a trained and disciplined professional, to have to attempt to communicate with a flock composed of substantial numbers of incompetent boobs! What a disgrace to the FCC, who probably want to strike #97.1 from their Rules!

****

For the sake of whatever credibility our Service still retains, I hope that there will be no further ARS operations from Columbia or Challenger.

More in sadness than in anger,

Gordon Schlesinger, WA6LBV
Dept. of Chemistry,
University of California at San Diego

The Radio Shack center loaded/right angle CB antenna will not work
on 2 meters.

The best way to go is either a right angle (elbow) coax connector on the
back of the rig and either a "duckie" or 1/4 wave whip.

Two things to be aware of when using a rig mounted antenna:

1) There is a lot of rf in the vicinity of the rig this way and the rf
   can get into the mic input and cause problems.

2) since the antenna will not have a perfect ground plane, an exact
   quarter wave (19 inches) may not be the length that provides the
   best impedance match. Many years ago we found out that a 21" whip
   worked best on the back of a Regency HR-2, for example.

Make your own whip and prune the length for the best results.

The best bet is to use an external antenna that can be hung up somewhere
(like the "J") or else a mag-mount type if it can be placed on a metallic
surface for a ground plane.

a

I'd like to correspond with anyone who has one of the new TAPR TNC's

or who has upgraded their Beta board to V 3.0 software.

The calibration routine won't light the LED's, so I had to calibrate the modem using a frequency counter. Some people have told me my tones aren't the same loudness, but that could be rolloff in my transmitter (ICOM 260-A). Regardless, my deviation is too low so I'm in the process of throwing together a preamp.

I can copy other packet stations with no problem, but they can't copy me. I don't know if it's a software problem (least likely), a bad chip, such as the VIA (a little more likely), or if I bollixed up the assembly (alas, most likely).

I don't know if this is significant, but at power-up, the RESET and SPARE LED's light okay, but the CWID LED lights at the same time, instead of turning on a couple of seconds later, like the manual says is supposed to happen. What *does* happen is the RESET, SPARE, and CWID LED's come on at the same time, together with the TXD LED. The TXD LED turns off a couple of seconds later and the sign-on message appears.

Also, is the RESET LED ever supposed to turn off? Mine never does.

The ROM checksums are correct.

Thanks in advance,

John Opalko

The FCC today abandoned its proposal to create a code-free amateur
license. The vote was unanimous despite the fact that the original vote
in January to propose the license was also unanimous.

The original chief of the Private Radio Bureau, James McKinney, whose
staff wrote the no-code proposal is now the head of the Mass Media
Bureau and his successor, Robert Foosaner, made the recommendation that
the commission drop the proposal, citing 5,000 comments that ran 20:1
against.

Personal comment: it does appear that, for better or worse, the FCC
weighs comments primarily on volume rather than on substantive
arguments. Sad.

to all radio amateurs bt

the fcc on december 14, 1983, voted in the strongest possible manner to retain the morse code requirement for all classes of amateur radio licenses. private radio bureau chief robert foosaner said that the amateur radio service is well, thriving, and providing an excellent service to the american public. he strongly recommended that fcc maintain the code requirement, endorse the service as it is, and bury the concept of no code. chairman mark fowler stated that the code is very important and in some cases essential for getting the message through. he said further that radio amateurs have contributed vitally to the country and recently were stalwart in performing communications with grenada. the vote was unanimous to reject the concept of no code ar

qst de ad7i
hr propagatin forecast bulletin nr 50 from arrl headquarters
newington ct december 12, 1983
to all radio amateurs bt

during the last half of november, solar activity was very low and there were days when no sunspots could be seen. after december 2, the sun began to look more as it should for this point in the solar cycle. the solar flux had been as low as 80, but it peaked at 112 on the 9th, just in time for the arrl 10 meter contest on the 10th and 11th. there was worldwide contest activity and the many impressive scores will show that this is no time to be writing off 28 mhz for the rest of the solar cycle. an outbreak of new sunspots is nearly always followed by an increase in geomagnetic activity and generally poor propagation in the higher latitudes of the northern hemisphere. we were close to auroral conditions as this bulletin was being prepared, and high absorption and severe fading are likely to be with us most of the time through the 15th. conditions will improve the next two days and remain quite good through the 21st. the balance of the month will be erratic, until the 30th, bit generally gmod propagation will close out the old year and usher in the new.

american sunspot numbers for december 1 through 7 were between 3 and 42 with a mean of 18.3 ar

I agree that there were turkeys who could not seem to stay off of the downlink frequency. I do NOT, however, agree with anything else which Mr. Schlesinger had to say.

A pileup is a pileup. Just because there were thousands of people trying to get ahold of Dr. Garriott doesn't mean that a 2-meter pileup is any worse than any other rare DX pileup on HF. You must admit that a ham in space is a lot rarer than your run of the mill DX. I didn't think it was too bad here in Chicago the one day I tried to call "the wild blue". I wouldn't turn my nose up at all 2-meter op's just because I never heard a royal pileup on such a special event before. Since there was no DX control standing by, sure there will be lids... it would have happened on 20 meters or wherever, too ! To illustrate that point just a little further, I heard a most nauseating ragchew on 40 meters a few days ago (AM phone, too). Is that representative of your band choice or your license class ?

Just because I have a new callsign, been a ham only about a year, and was a babe when you OM's were tearing apart 2-meter boat-anchors, doesn't necessarily mean you guys are any more technically capable than I am. You may know more about tubes, but I probably know more about MOSFET's and IC's! My Technician class effectively keeps me off of the low bands, and so all of my computer-based crowd congregate on the higher bands. We are more interested in state-of-the-art things like microprocessor-controlled repeaters, autopatch, voting repeater networks, RTTY, packet radio networks, crossband links, satellite and auroral operation, and even moonbounce than we are interested in getting our code speed up to unbelievable levels (our processors can do that... why bother?). I think there is more technology on 2-meters than on any other band! By the way, I have a 2-meter boat anchor in my basement, too! I use it to hold my Kenwood 7950 2-meter rig (which is the only one I have).

I see no reason to work on my code on the low bands if all the OM's are going to treat me like a member of an inferior race because I can't operate a CW hand key as well as they can. How many times have I seen some ancient Extra callsign write into QST or '73, complaining about the quality of code on the Novice HF CW bands? Remember, they are NOVICE bands! Don't scare all of us newcomers away! If you want to KILL CW for good, just keep complaining about our code... pretty soon we'll give up. And when you old guys die off, there'll be NOBODY to replace you on the CW bands!

Getting back to the main point, I hope NASA *DOES* allow more operation from space. Sure, we might have to change the protocol somewhat, but there's a first time for everything. I saw a TV news story about our working Columbia, and I feel we came across to the public very well.

Long live amateur radio ! Long live computers ! Long live 2-meters !

a

Yes, but this *isn't* like HF DX operations. When working a DX station, you have no well-defined frequency on which to call him, unless he specifies "listening 25 up" or whatever. The W5LFL operation *did have* well-defined frequencies for use, ten uplink and one downlink. Sure W5LFL was the rarest DX in the history of Ham Radio. Sure a pileup was expected, but *not* on his downlink frequency. The pileups should have been on the uplink frequencies. If somebody is calling during the wrong minute (on the proper frequency), he's hurting no one but himself. But when you get a bunch of lids yelling on Owen's *downlink* frequency (especially during the wrong minute), then everybody is being hurt.

These people must have seen Owen's operating schedule (at least they seemed
to know when he was within range) so why couldn't they at least select the
proper frequency, even if they can't tell even minutes from odd?

     John Opalko, KA9MNK

Does anyone have any experience interfacing the TAPR
boards to the IBM PC? In particular, I am looking for
mailbox programs.

We are planning to provide digital communications
between our location in Tucson with our sister organization
in Chile. We currently use HF radio for voice and RTTY
and plan to replace the RTTY with packet.
Due to the 3-4 hour time difference, we would like to
be able to store message in the PC and download them
to the TAPR board starting at 5AM, and also receive
new messages with no operator present.

We operate just below 21 Mhz on a nice clear gov't channel.
Generally communications quality is excellent.
Does anyone have experience running packet at these frequencies?
What baud rates might one hope to reliably achieve?

If you scan your local newspapers, you may have come across a rather
unusual story.

It seems that a woman in Rhode Island happened to tune her AM radio up a
little too high and came across a cordless telephone conversation of a
drug dealing ring. She reported it to the police, who began listening
themselves for a period of 6 weeks. After taping something like 100
hours of incriminating conversations (no warrant was necessary) they
just busted the whole bunch.

The moral should be obvious.

73, Phil

Can anyone recommend any particular brand of communications headphones? I do a lot of cw dxing and contesting.

What I'm looking for is a pair that is comfortable, even after hours of wear. The pair I have now do a number on my ears after about half an hour and I have to take them off for relief.

Thanx

  I use an Azden PCS-2000 for my 2m mobile rig. I have found this to be
a very nice rig. The PCS-3000 and PCS-4000 have fixed several problems
with the design of the 2000. It does have a small control head, about
the first 2 inches, and a 10 foot cable to the "rest of the guts." With

that small a control head, it does not have the speaker. It does have a speaker jack if you put the rest of the guts is some place where you can not hear the speaker. It is also synthesized. It also has at least 6 memories for your favorite frequencies. The 3000 and 4000, as I recall, also remember the offset along with the frequency. These memories may also be scanned. It has two power settings, the high power being 25 watts.

  A better place to find out all the things is to look in QST or Ham Radio for an advertisment. What I wanted to do was to let you know that I would buy another Azden if I had the money. I am very happy with the PCS-2000, with the exception of a few things, that seem to be fixed in the 3000 and 4000.

The Oscar-10 mode L transponder (1269 up, 436 down) was turned on for the first time a week ago with disappointing results. The downlink was excellent, with steady non-fading signals, but the uplink receiver performance was more than 20 db worse than expected. While the spacecraft beacons were of excellent quality, very few stations could get enough power into the satellite to rise above the noise level; the strongest was only 6db above the noise.

A theory was constructed having to do with the relay that switches the receiver between the high and low gain antennas. Since the first test, this relay was toggled a number of times under ground command. The second mode L test was conducted this week and the following bulletin was later loaded into the onboard computer:

M FROM DJ4ZC, 28.9.83: THE MULTIPLE SWITCHING OF THE 24 CM
ANTENNA RELAY RESULTED IN A 10 - 20 DB IMPROVEMENT OF MODE L
PERFORMANCE. NOW PERFORMANCE IS ABOUT 10 DB BELOW NOMINAL AND
A NUMBER OF STATIONS HAD VERY GOOD SIGNALS. THE MODE L RX ON THE

OMNI RESULTED IN A 12 DB LEVEL REDUCTION. CONCLUSION: WE HAVE AN
ANTENNA RELAY PROBLEM. FOR SSB QSO'S AN EIRP OF 40 DBW OR MORE
IS SUGGESTED. OVER THE WEEKEND ATTITUDE WILL BE CORRECTED AND
THEREAFTER CONTINOUS MODE B (EXCEPT L-DAY) IS PLANNED. KARL

The guess that the relay was at fault is apparently correct, and I'd
suspect that some further toggling of the relay should help things
further. The advantage of the mode L transponder will be that it has a
wider bandwidth (800 khz vs 150 for mode B), better antennas since the
70cm and 23cm high gain antennas were apparently uninvolved in the
launcher collision, and better downlink performance since the cosmic
noise background is much lower on 70cm than on 2m.

The Keyboard on the IBM Personal Computer is very sensitive to RF
fields. The problem is about the same on an old keyboard as well as on
one recently manmufacured.

Surely this problem has come up before as a 1KW transmitter would
tickle PC's for several blocks.

Does anybody (especially IBM) know of a fix?? The PC is fairly quiet
on the ham bands (provided the cables are shielded and/or filtered)
but the KB is about 20 db too sensitive.

On the repair of cordless phones, Cliff Shackelton writes:

> ----------
>
> ".... since cordless phones are also covered under FCC part 68, A FCC 2nd or 1st class license doesn't mean diddly squat. Only the factory or it's authorized agent may repair a phone. If you want to repair phones you need to send a repaired unit in for FCC Part 68 testing and submit the data to the FCC and get a FCC number to stick on the bottom of the phone....
>
> FLAME OFF"
> ----------

My apologies. My first article was based on a September 28 regulatory discussion with Ms. Flora Stewart, FCC Field Operations Bureau in Chicago.

After reading Cliff's heated response on October 3, I called

the FCC, and spoke with a Mr. Sklom. This fellow contradicted the information given in the first conversation!

Pardon posting but my system won't mail to seismo!

Mark:
The second & first class R/T licenses (commercial) were merged a little over a year ago. If you renewed it longer ago than that, it will be replaced on the next renewal with just a "General" R/T license. There is no difference in priveleges for a first/second class licensee.

There is a docket pending, I believe, that would eliminate the requirement
of a FCC licensed technician for repairs/adjustments of many items.
The FCC has slowly been de-regulating away to the point where someday
the commercial license won't be needed for anything. (I remember being
shocked to find out that broadcast stations no longer needed a frequency
monitor). Back when I was in the BC biz, we had to have a 1st class
licensee on duty at the transmitter all the time the transmitter was on.
I don't think that directional AM stations even need to have a full-time
1st fone (now general radio-telephone) on the staff any more, right??

HR ARRL BULLETIN NR 90 FROM ARRL HEADQUARTERS
NEWINGTON CT SEPTEMBER 27, 1983
TO ALL RADIO AMATEURS BT

AT ITS SEPTEMBER 22 MEETING, FCC ADOPTED A REPORT AND ORDER IN
DOCKET NO. 83 27, CONCERNING VOLUNTEER EXAMS. ALTHOUGH THE
COMPLETE REPORT HAS NOT BEEN RELEASED, ARRL HAS LEARNED SOME OF
THE CONTENTS. FCC ENVISIONS THE ESTABLISHMENT OF REGIONAL
VOLUNTEER EXAM COORDINATORS INSTEAD OF NATIONAL VECS. FCC WILL
HAVE THE POWER TO RETEST ANYONE WHO RECEIVES A LICENSE FROM A
VOLUNTEER ADMINISTERED EXAM. THE PROGRAM WILL START WITH GENERAL
AND TECHNICIAN. THE OTHER TWO CLASSES WILL BE ADDED LATER.
THIRTY DAYS ADVANCE REGISTRATION WILL BE REQUIRED OF APPLICANTS.
INSTANT UPGRADING WILL BE PERMISSIBLE. THE TELEGRAPHY TEST
REMAINS THE SAME AS NOW, I.E. A SENDING TEST IS PERMISSIBLE BUT
NOT REQUIRED. MEMBERSHIP IN AN ORGANIZATION CANNOT BE A
REQUIREMENT FOR PARTICIPATING IN A TEST. THIS BULLETIN WILL BE

UPDATED WHEN FCC RELEASES THE TEXT OF THE REPORT AND ORDER AR

QST DE W1AW
HR PROPAGATION FORECAST BULLETIN NR 40 FROM ARRL HEADQUARTERS
NEWINGTON CT OCTOBER 3, 1983
TO ALL RADIO AMATEURS BT

THE SOLAR FLUX AVERAGED JUST OVER 109 IN SEPTEMBER, THE LOWEST VALUES
SINCE LATE 1947. SOLAR ACTIVITY WAS RISING AFTER THE 20TH, THE TREND
CONTINUING INTO EARLY OCTOBER. THE FLUX REACHED 120 ON THE 2ND, THE
HIGHEST SINCE THE MIDDLE OF AUGUST.
THE SOLAR FLUX RISE REPORTED LAST WEEK IS EXPECTED TO FLATTEN OFF IN
THE 120S AND START DOWN ABOUT THE 4TH. THERE WILL BE ANOTHER LOW
PERIOD ABOUT THE 7TH TO 20TH. A RISE EXPECTED AT THE END OF OCTOBER
SHOULD BRING THE BEST OVERALL PROPAGATION OF THE AUTUMN SEASON TO
DATE.
ABOVE AVERAGE MAGNETIC FIELD ACTIVITY BEGINNING ABOUT OCTOBER 5, 13,
17, 23 AND 28 WILL CAUSE INCREASED SIGNAL ABSORPTION AND SEVERE
FADING OVER PERIODS OF ONE TO THREE DAYS. THE MUF WILL TEND TO PEAK
ABOUT OCTOBER 4, 7, 14, 25 AND 29, REACHING ITS HIGH FOR THE MONTH ON
THE LAST TWO DATES.
AMERICAN SUNSPOT NUMBERS FOR SEPTEMBER 22 THROUGH 28 WERE BETWEEN 39
AND 54 WITH A MEAN OF 46.7 AR

Over the weekend, a "software fuse" in the Oscar-10 onboard software
tripped several times, shutting off the Mode B transponder. A routine
which checks several vital parameters in the spacecraft detected that
the battery voltage was below a specified limit and shut the transponder
off. This caused quite a bit of concern among the users, as the beacon
could be heard but no stations could access the transponder.

The problem was that the satellite began experiencing solar eclipses for
the first time since launch, starting about 20 September. As the
eclipse durations increased (they will reach a maximum of about 35
minutes later this month), the battery, which then has to supply the entire
spacecraft load, dropped below a trip point of 13.0 volts. This was
clearly too high and has since been reduced to 11 volts. The satellite
went back into normal operation yesterday and no more problems are
anticipated.

Last week, Bob, K9EUI asked about the Morse characters for various punctuation characters. Since I saw no comment or reply on the net, I am hoping that someone supplied them. However, on the off-chance nobody came thru and/or others may be interested, I quote from the ARRL publication "Learning the Radiotelegraph Code", copyright 1957 (when Headquarters was still located in Hartford, Conn.):

SPECIAL SYMBOLS

In transmitting text there of course is a need for code symbols for punctuation marks and some special procedure signals to facilitate rapid transmission. The important ones are:

Period	didahdidahdidah	._._._	
Comma	dahdahdididahdah	__.__	
Question mark	dididahdahdidit	..__..	
Double dash	dahdididididah	_..._	(BT)
End of message	didahdidahdit	._._.	(AR)
End of work	didididahdidah	..._._	(SK)
Wait	didahdididit	._...	(AS)
Invitation to xmit	dahdidah	_._	(K)
Hyphen	dahdidididididah	_...._	
Parentheses	dahdidahdahdidah	_.__._	
Colon	dahdahdahdididit	___...	
Semicolon	dahdidahdidahdit	_._._.	
Quotes	didahdididah	._.._	
Error	didididididididit	....	
Apostrophe	didahdahdahdahdit	.____.	
Fraction Bar	dahdididahdit	_.._.

hr arrl bulletin nr 90 from arrl headquarters
newington ct september 27, 1983
to all radio amateurs bt

at its september 22 meeting, fcc adopted a report and order in
docket no. 83 27, concerning volunteer exams. although the
complete report has not been released, arrl has learned some of
the contents. fcc envisions the establishment of regional
volunteer exam coordinators instead of national vecs. fcc will
have the power to retest anyone who receives a license from a
volunteer administered exam. the program will start with general
and technician. the other two classes will be added later.
thirty days advance registration will be required of applicants.
instant upgrading will be permissible. the telegraphy test
remains the same as now, i.e. a sending test is permissible but
not required. membership in an organization cannot be a
requirement for participating in a test. this bulletin will be
updated when fcc releases the text of the report and order ar

hr propagation forecast bulletin nr 40 from arrl headquarters
newington ct october 3, 1983
to all radio amateurs bt

the solar flux averaged just over 109 in september, the lowest values since late 1947. solar activity was rising after the 20th, the trend continuing into early october. the flux reached 120 on the 2nd, the highest since the middle of august.

the solar flux rise reported last week is expected to flatten off in the 120s and start down about the 4th. there will be another low period about the 7th to 20th. a rise expected at the end of october should bring the best overall propagation of the autumn season to date.

above average magnetic field activity beginning about october 5, 13, 17, 23 and 28 will cause increased signal absorption and severe fading over periods of one to three days. the muf will tend to peak about october 4, 7, 14, 25 and 29, reaching its high for the month on the last two dates.

american sunspot numbers for september 22 through 28 were between 39 and 54 with a mean of 46.7 ar

Thanks to all that responded to my Morse code question.

(Lindsay, there is a dit missing at the end of the quote character
you had in your chart - maybe the ARRL was wrong....)

I guess part of my confusion was due to an old article I had (I just
found it again) that was printed in 1939 and gave both the original
Morse code and the Continental code. The Continental (International)
Code is the same as we use today except for a few punctuation
differences. The Continental Code was created in 1875 at a convention
held in Russia. The differences in it and the code we use today are:

	1875	Today
Period	.. .. ..	._._._
Comma	._._._	__..__
Exclamation	__..__	none

I wonder when it got changed.

The FCC yesterday unamiously decided to extend the license term
of amateur radio licenses from 5 to 10 years. The change will
be phases in gradually; as the current 5 five licenses expire,
they will be renewed with 10 year tickets.

hr arrl bulletin nr 93 from arrl headquarters
newington ct october 7, 1983
to all radio amateurs bt

the arrl board of directors held its second meeting of 1983 on october 5 and 6 in houston, texas. the following resolution was unanimously adopted.

whereas, the continued availability of amateur license examination opportunities and the integrity of the examination process are both vital to the future of the amateur radio service in the united states, and

whereas, in its report and order in pr docket no. 83 27 the fcc has outlined a volunteer examiner program in which arrl participation as volunteer examiner coordinator, vec, is both desirable and appropriate, and

whereas, legislation is to be introduced which, if enacted, will permit the recoupment of out of pocket administrative expenses of a vec, such recoupment being essential to arrl participation, now, therefore

be it resolved that the league participate as a volunteer examiner coordinator, such participation, however, only to commence upon governmental authorization for recoupment of vec expenses and approval of any agreement between arrl and the fcc by the board of directors.

in another regulatory matter, the league will petition fcc to adopt american national standards institute standard c95.1 1982 as an interim rf protection guideline and thereby establish federal preemption in this area. the arrl will petition the fcc for rtty privileges on the 160 meter band. the board endorsed the concept of early iaru preparation for the next general world administrative radio conference.

in other matters, the board amended the bylaws to allow technician class licensees or higher and canadian amateur certificate holders or higher to run for elective arrl/crrl office. the arrl president was authorized to sign an agreement with the quarter century wireless association, embracing a plan of mutual support and cooperation. the board also authorized the signing of a memorandum of understanding

with the associated public safety communications officers, apco. the arrl letter will be made available at reduced cost to arrl affiliated club newsletter editors and to section level appointees. san diego was chosen as the site for the 1986 national convention. complete minutes will appear in december 1983 qst ar

qst de ad7i
hr dx bulletin nr 39 from arrl headquarters
newington ct october 7, 1983
to all radio amateurs bt

thanks to k1mm, n1ajo and w1trc of the southern new england dx association for the following dx information.

kampuchea. confirmations for the recent kampuchea, xu, operation will be accepted for dxcc credit. one of the local operators trained by the japanese group has been appearing frequently on 20 meter ssb at both european sunrise and usa sunrise. the operator is learning quickly how to handle pileups, but since there is no split operation at the present time, please have patience. qsl to ja1hqg.

niue. zl1amo is currently signing zk9rw from niue island. ron is using the special zk9 prefix in commemoration of wcy. the operation is expected to last approximately one more week, mostly cw. qsl to zl1amo.

nigeria. 5n8ary, arye, is often working 40 and 80 meter ssb and cw near the low band edges. qsl direct to his callbook address. he expects to have his 160 meter antenna back up in a few weeks.

liechtenstein. frank, hb9nl, continues his month long operation as hb0nl, cw only. he is frequently visited by hb9hk, who operates as hb0hk on rtty. qsl to their respective home callsigns.

tuvalu. ordon, t2gsh, has been reported now active on 80 meter ssb but with a rather weak signal in north america.

greece, etc. sv0aa is now operating as sv0aa/8 and is planning to make a trip to sv5 and sv9 in the near future. remember that jack is now qrv on 160 through 10 meters, cw only.

juan fernandez. ce0evg/0z, operated by rudy, a resident of juan fernandez island, is regularly on 20 meter ssb around 0100 to 0300z. qsl to wb6wod.

antarctica. richard, vp8ant, is preparing to leave his post within a few weeks and will return to the uk. check 10 khz from the bottom on cw and the usual dx frequencies on ssb. qsl direct to p.0. box 146, cambridge, england.

china. by1pk was operated on ssb last week for four days. signals were weak and not many stations were worked. the operator was tom wong, ve7bc. however, due to qrm and jamming on the frequency, it is rumored that ssb operation may not be allowed again, at least for a while. a japanese group will go to shanghai next week and start up a new station, by4aa. it is unknown how long the operation will last or whether there will be all band all mode operation.

the sudan. for waz hunters, look for df3nz/st2, who has surfaced again, this time on 80 meter ssb around 0130z.

160 meters. many ussr stations have been worked in north america over the last week, including ua, ua9, uq2, up2 and ub5. with decreasing sunspot numbers, low band conditions will continue to improve, so this is a band to watch carefully.

st. paul island. when last heard, the combined american/canadian dxpedition, cy0spi, had made over 15,000 qsos, spread over nine bands and four modes. qsl to ve1asj. congratulations on a fine expedition.

zone 2. ve8dx will be active on ssb and rtty with some cw. look for bob on 1825 khz at 0000z, on 80 at 0900, on 40 at 0700 on 7234 khz, and on 20 at 1500z on 14178 khz.

belize. listen for v30, v3t, v30yl and others october 22 through november 5, on 160 through 10 meters. cw will be emphasized before the cq ww contest. qsl via n6 -8 ar

Subject: Product Review: PRO-30 synthesized portable scanner
Message-ID: <751@ihuxf.UUCP>
Date: Mon, 10-Oct-83 11:23:01 EDT
Article-I.D.: ihuxf.751
Posted: Mon Oct 10 11:23:01 1983
Date-Received: Tue, 11-Oct-83 00:26:07 EDT
Organization: AT&T Bell Labs, Naperville, Il
Lines: 201

I recently purchased a Radio Shack PRO-30 synthesized handheld scanner. Here are some details:

- Price: $300.

- Batteries are not included. The PRO-30 requires 3 "hearing aid type" batteries for memory retention and 6 AA batteries.

- Frequency coverage is fixed. The manual states: "In case you're wondering, the tuning range of your PRO-30 is permanently stored in the microprocessor chip. There's no way it can be extended or altered - even by a skilled electronics technician. So if you try to enter a frequency not in the PRO-30's tuning ranges, you'll get an error message every time!"

    - 30 - 54 (includes entire 6 meter ham band)

    - 108 - 136 (AM commercial aircraft band)

    - 138 - 174 (includes some military frequencies below the 2 meter ham band)

    - 380 - 512 (several military and "secret" US government frequencies in this range)

- Semiconductor components: 1 LSI microprocessor, 1 LSI PLL chip, 3 CMOS chips, 5 other chips, 39 transistors, and 75 diodes!

- Selectivity: +-9 KHz @ 6 db., +-15 KHz @ 50 db.

- Scanning rate: Fast = 10 channels/second, Slow = 5 channels/second.

- IF frequencies: 10.7 MHz and 455 KHz.

- Current drain (not including memory backup cells): 55 mA squelched, 100 mA unsquelched at full volume.

- Priority Sampling: 2 seconds.

o+ BNC antenna connector. A multi band semi-flexible antenna is supplied.

o+ The case is plastic, with a hinged, spring loaded belt clip on the rear. The inside of the case has been sprayed with some type of gold colored RFI shielding material.

o+ The keyboard buttons are made of a rubber type material, that compress slightly when depressed. An audio tone is used to confirm key depression.

o+ Three pushbutton switches on the top of the unit duplicate functions on the front mounted keypad:

a. Scan

b. Manual

c. Speed

This allows the user to manipulate these functions while the scanner is worn on the belt.

o+ The PRO-30 is made in Japan by GRE, the same company that makes Radio Shack's crystal controlled scanners.

o+ The owner's manual contains a block diagram, but no schematic. I am told that a service manual, with schematic, will be available for sale. The owner's manual contains a list of "birdies."

Some early impressions:

o+ The scanner works quite well.1

o+ The instruction manual is pretty good, although a schematic should be included.

o+ The scanner is bigger than the Bearcat BC-100. No leather case is available to protect the PRO-30, so the scanner could be "bruised" in heavy service.

o+ The LCD display contains several status indicators, including a low battery warning message.2 The display

---

1. The PRO-30 being reviewed is one of the first available in the northern Illinois area. Early models of complex radio equipment from other companies have been plagued by several problems. Examples are the Drake TR-7 transceiver, the Bearcat BC-100 and BC-300 scanners, and the Collins KWM-380 transceiver.

2. The user is also warned of failing batteries by a audio alarm.

is quite crisp and clear in good light, and when the internal dial light is activated. It is difficult to read under low lighting conditions and at various angles, a characteristic of LCD technology.

o+ Striking a key does not always actuate the desired function. If a key is struck off center, the rubber key top compresses without actuating the switch mechanism. The user is made aware of this situation when no audio tone is heard after a key depression.

A nice aspect is that the keyboard is less prone to damage if it is struck against the corner of a desk.

- Sensitivity on UHF is at least as good as the several crystal controlled portable scanners I've aligned, maybe even better!

- The internal construction looks decent. There are two printed circuit boards in the radio, connected via a multi pin connector rather than messy wiring harnesses. The component designations (e.g. R102, C212, etc.) are printed on the board. Resistors are 1/8 watt and mounted vertically. Layout appears clean, not over-crowded.

- The priority scan feature works well and uses a "reasonable" algorithm, like that used in most Bearcat and Regency scanners.3

- Audio output circuitry uses the LM386 audio amplifier chip, producing about 220 milliwatts of audio power out.4 This is a bit on the weak side if your using the scanner in a truck, or wearing it in a noisy situation without benefit of an earphone. The audio is crisp and clean, without synthesizer noise.

- The 2nd IF, FM detector and squelch circuitry is implemented using a Motorola MC3357 IC, now quite common in scanners.5

---

3. The algorithms used in most Japanese 2 meter ham radio transceivers, discussed in a previous article, are not very useful to American amateurs.

4. The LM386 is also used in the PRO-24 crystal controlled handheld scanner, reviewed in a previous article.

5. The squelch function works quite well and is not plagued by the hysteresis problem found in the PRO-24.

For those of you looking for something completely different, try this:

Last night, while tuning the range 1.6-1.8 mhz looking for cordless telephones, I came across a guy calling himself "KPRC, Pirate Joe" on 1.616 mhz. This guy claimed to be running THREE simultaneous transmitters from somewhere in New York on AM, shortwave (6.280 mhz) and FM stereo (91.5). I was able to hear the first two but not the FM signal.

This guy was quite talented. His signon was "Who's afraid of the Big Bad Wolf?" He played music, naturally enough, but the most entertaining part of his show was the telephone call-in. He gave a New York number but suffix of the number was 99xx, which I suspect was a port of an internal telephone company conference bridge (to avoid tracing, of course.) His first caller was from a fellow pirate ("WDX") who said he would resume operations around Thanksgiving. Another caller was a SWLer who read off a long list of other pirate operations that she had heard. They then got into "hey, did you hear that so-and-so got caught by the FCC a while ago and got fined $2000? How much do you think you'd get fined if you got caught?" "By the way, how much power are you running?" "Now you know the ground rules, there's certain things we can't talk about over the air..." etc, etc. Naturally, a pirate radio station wouldn't be a pirate radio station without political harangues, so he then went on awhile about Ronnie and Central America. Then he played a pretty good parody of "Electric Avenue" called "Stupid Avenue", by Pirate "N" and the Plate Tuners.

This went on for quite a while, with phone calls from places like Chicago and London, Ontario, until at 2:30AM I decided I needed some sleep. He gave a PO box in Exeter, NH to which listeners could write

for QSL cards, etc. I have about an hour or so of him on tape.

I think I'll have to drop him a line. It'd be a shame for this guy to get thrown off the air, he was so much more entertaining than the usual soul-saver drivel on the AM stations!

Happy listening,
Phil

It looks like this pirate station has been operating on 1616 KHz for at least a year now. The "Free Radio Focus" column of Popular Communications magazine for July 1983 makes reference to this station:

" ... The first bit of information this month comes from my cousin, Bob Kratzer in Allentown, Pennsylvania. Bob Reports hearing KPRC in New York sporadically on Sundays on 1616 KHz between 0600 and 0800 GMT. Their programming is a mix of editorials, phone calls from listeners, and assorted music. One November 3 [1982], they discussed the New York elections, but had a slight problem with their phone line, which was telephone number (212)799-9906. On December 31 [1983], the highlight of the night was someone calling to complain that KPRC was RFI'ing a neighbor's stereo ... thank goodness the call was only a prank! Their address is:
P. O. Box 747, Exeter, NH 03833 ..."

This column is a regular monthly feature in Pop Comm. Starting with the October 1983 issue, the column has been renamed "Pirates Den", and been given a new editor.

I am looking for schematic diagrams and parts sources that will enable me to home-brew solid state tube replacements for my old DRAKE C-line.

Years ago I purchased four solid state tubes from Sartori Associates Associates, W5DA and placed them in my R-4C. They have worked fine and I have no complaints. At the time I corresponded with Howard Sartori about the Solid Tubes and was informed that he could not develope a solid tube that would perform better than the glass (6BA6) tubes. Around the same time Howard published an article in QST describing his Solid Tubes:

"Solid - Tubes - a New Life for Old Designs
by Howard J. Sartori W5DA
QST, April 1977, page 45 "

Since that time technology has improved (namely the invention of

VMOS) and I have decided to convert as much of the old C-line to solid state as I can.

I wrote Mr. Sartori to see what new products might be available and if he had any new designs he might be willing to share with me. Howard now has developed solid state tube replacements for all the tubes in the DRAKE C-line (including the 6BA6) with the exception of the 6JB6 finals and the 12BY7A driver. He promises to have a solid state tube replacement for the 12BY7A some time this fall. The bad news is the price of the Solid Tubes ($23.00 each) which I find to be a little prohibitive. Secondly Howard is not giving out any design information for these new Solid Tubes.

After reading over the article he wrote years ago, it appears that he is using some very high voltage solid state devices and I do not know where to purchase them. I also feel that there must be better designs around now that VMOS devices are available.

If any of you have the designs or parts sources I need, I would appreciate some mail to the effect.

Does anyone know about the Regency ?7000 scanner?
I've heard that it scans from 24mhz to 1.2Ghz...

Also, where can one be found at a discount??
(Mail order or whatever...)

LAKE MICHIGAN AREA MARINE RADIOBEACONS (USCG)

Most marine radiobeacons must share a group frequency with other beacons. Beacons in the same general geographical area are divided into groups of up to six beacons per single frequency, with the sequence repeated continually. Each radiobeacon transmits for at least one minute out of the total period of six minutes (SEQ 1 starts on the hour). In the following list, where no SEQ number is shown, that station is a low powered local beacon that transmits continuously, transmitting either a Morse character or half second dashes. The last ten seconds of the sequential beacon's transmission is a long dash for maximum accuracy while taking direction fixes. ID's in "()" are those monitored but not appearing in Coast Guard documentation. Sequential beacons generally have a range of 40 to 100 miles, while the local ones are not given. The chart below shows SEQ numbers vs. minutes after the hour.

SEQ	1	2	3	4	5	6

greetings from ad7i ---------------------------------------

does anyone have experience with operating on 160 to 190 KHz.
i am interested in using it for packet and/or AMTOR communications.
any information anyone can offer would be appreciated.

tnx -- paul newland, ad7i

I suggest that you look through the Supertex and Ferranti
Power FET lines. You might also consider combinations of
a Depletion(naturally0 JFET and an Enhancement V-FET
for tube replacements.   I don't know of any useful
depletion mode Power FET's, partly because the mechanism that
most of the Power FETS use is easier done in enhancement
mode. With a few circuit componenets, though, making
single device replacements for many low frequency tubes
isn't impossible.

I recently hacked up a couple of power fet's into an
old tube (audio) amplifier for the heck of it. There
weren't any real complications other than the fact that
I had to make the bias supply positive rather than negative.

If anyone out there has more info on these tube replacements,
let's hear it! I'm interested for other than tube replacement
reasons. <sigh>

In general aviation we got designated examiners to give us flight tests
if we didn't want to wait for 2 months, or wanted to do it on a weekend.
Well these guys now charge $50 for a flight test and $30 for a written
test. The $4 of vec seems inconsequential now, but .. could it grow????

Lines: 40

You're talking about the MX7000 Regency scanner, list price about $600.

I spoke with Regency yesterday (10-12-83), and was told that this model would be shipped to dealers during the summer of 1984. I think the dealers have been given an earlier date, so it's ambiguous at this point.

Discount scanner dealers include:

o+ Gaxaly Electronics, Box 1202, Akron, OH 44309, (216)376-2402

o+ Communications Electronics, 818 Phoenix, Box 1002, Ann Arbor, Michigan 48106, (800)973-8888

o+ Scanner World, USA, 10 New Scotland Ave., Albany, NY 12208, (518)436-9606

Unfortunately, the specifications sheet for the MX7000 does not specify continuous frequency coverage.

Its limited 20 channel capacity may prove insufficient for programming in all the frequencies in a large 800 MHz trunked system, or cellular mobile telephone frequencies. An editorial on the MX7000 appears in the October 1983 issue of the Radio Communications Monitoring Association (RCMA) Newsletter.

Several years back, Bearcat introduced an 800 MHz scanner, but it was removed from the market due to technical problems.

One of the largest VLF/LF clubs in the United States is the Longwave Club of America. This club publishes a monthly newsletter, "The Lowdown", in which Ken Cornell, W2IMB, writes a column devoted to 1750 meter operation. The column contains equipment schematics and antenna information for this experimenters' band, as well as information on beacons and activity there.

Ken Stryker, of Chicago, writes the "Lost and Found Department" column, identifying various VLF beacons (air and marine) for members.

The club address is:
Longwave Club of America
45 Wildflower
Levittown, PA 19057

Membership dues are $10 a year, which include First Class mailing of the newsletter. The newsletter is good ... no hype or commercial advertisements. Looks like a decent club for those interested in operation at low frequencies.

newington ct october 13, 1983
to all radio amateurs bt

sts9 update. launch is scheduled for 1630 utc october 28. nasa is investigating a problem with the solid fuel booster rockets that could force a postponement, but the tests thus far have been inconclusive. no decision has been made yet, but is expected by october 18. currently, nasa is operating on the assumption that sts9 will lift off on schedule.

for u.s. stations, sts9 ham operations will be as follows. dr. garriott will transmit on 145.55 mhz, with 145.53 or 145.57 as backup. he will listen only on 144.91, 144.93, 144.95, 144.97, 144.99, 145.01, 145.03, 145.05, 145.07 and 145.09 mhz. he will not listen on his transmitting frequency. w5lfl will transmit for the 60 seconds of each even minute and will scan the ten receive channels for the 60 seconds of each odd minute. when calling, say columbia w5lfl only once, followed by your call several times. for operation to be possible, dr. garriott must be off duty and awake and the columbia must be in the right attitude. see november qst for a schedule of orbits that are most probable for operation.

during the flight of sts9, the goddard space flight center amateur radio club station, wa3nan, will be retransmitting shuttle communications on 3.860 and 147.45 mhz as long as audio is present. additional frequencies, as conditions permit, will be 7.185, 14.295, 21.390 and 28.610 mhz. when video is available from sts9, wa3nan will retransmit it on 439.25 mhz and it will also be sent by wa9gvk/r on 426.25 mhz.

the deadline for submitting footage of hams working sts9 for inclusion in the new frontiers videotape is november 17. we need broadcast quality, 3/4 inch umatic cassettes. send the tapes to sts9, public information office, arrl hq. all submissions must be accompanied by a release form from the tv station shooting them ar

It is indeed true that STS-9 may be delayed because of
faulty heat protection on an SRB nozzle. More complete
information may be found in net.columbia.

b
Volunteer flight examiners are not required to charge for their time. I paid $15 to the examiner for my private license; but I got a lesson out of it as well. You take your pick; you pay taxes and somehow pay all money to all these diddling little services; or you pay for what you use. Anytime you can replace so-called "free" government services with pay-on-demand private equivalents, I'm going to think a long time before criticizing.

I recently read the news on HT advice, and felt I should point out some lesser known facts about the ICOM 2AT.

1. One of the most important aspects of an HT is its battery lifetime. How often have you heard someone sign off due to low batteries. The 2AT allows use of standard alkaline cells which provide about 4 times the operating life of the nicads. This is especially important if you have an emergency situation.

   The reason alkaline cells will work in a 2AT and not many other HTs is because the ICOM has an operating voltage regime of 6 - 16 volts, whereas most other HTs require

a fairly tight 8 - 10 or so volts, and alkaline cells
tend to slowly drop in output voltage with time.

Also, because the 2AT is a simple no-frills HT, the current
drain is relatively low (squelched: 18ma, receive: ~40ma.)

2. The 2AT has one of the most sensitive receivers of the HTs.
   This is only important if you plan to operate simplex much.
   I once had a simplex QSO over 275 miles to a Yaesu FT-207R.
   I could copy 100%, but I was only marginally detected.
   (Both of us were on mountain tops at the time. Otherwise,
   there were no abnormal conditions.)

3. Perhaps because of the receiver sensitivity, intermod is
   particularly bad with the 2AT. This is only a problem in
   heavy rf areas with external gain antennas.

In addition, I would recommend for any HT user that the rubber duck
antenna be ignored. At least use a quarter-wave whip, and I find
a 5/8ths wave (esp. Vocom) to work as advertised. That is, you
DO get about 10 db gain over the rubber duck. That's a big
difference.

While checking my watch against WWV on 15 mhz, I noticed a weak signal
in the background that appeared to be another standard time station (no,
it wasn't WWVH, which was also barely audible.) It had seconds pulses
consisting of tone bursts about 100 ms or so long that were about 1/2

second late with respect to WWV. On the 29 and 59th minutes of the hour
it signed "BPM" repeatedly in mcw. In my references this isn't listed
as a standard time station. The prefix "B" is supposed to be China. Any
ideas?

Phil

qst de ad7i
hr propagation forecast bulletin nr 42 from arrl headquarters
newington ct october 17, 1983
to all radio amateurs bt

two of the largest active areas seen on the sun in recent weeks
brought the solar flux to a two month high of 140 on october 13. the
first of these areas will disappear around the west limb by october
18 and the other is only a few days behind it. thus we see the solar
flux dropping sharply, to 112, on the 16th. a reversal and a gradual
rise are expected after about the 20th.

fairly high geomagnetic activity has kept propagation to better than
fair on all circuits traversing the higher latitudes. this will
continue, except for brief periods of good conditions centered on
october 20, 27, and november 1.

the falling off of high latitude muf with decreasing solar activity
is apparent from the propagation charts in qst for october, pages 66
and 67. the muf will continue high on north south paths, and to a
lesser extent on all transequatorial circuits. the next six weeks or
so will bring the highest muf and the most favorable dx con itions of
the entire year, for a given level of solar flux.

american sunspot numbers for october 6 through 12 were between 81 and
133 with a mean of 102.3 ar

       According to Oliver Ferrell's "Confidential Frequency List",

5th edition, the following standard frequency and time signals stations may be found in the band between 14,990 and 15,005 KHz.:

Freq. in KHz.	Mode	Call	Location	Power (Kw.)
14,996	a1	RWM	Moscow, USSR	8
15,000	a2	LOL1	Buenos Aires, Argentina	2
	a1/a3	BPM	Xian, PRC	50
	a3	WWVH	Kauai, Hawaii	10
	a2	ATA	New Delhi, India	8
	a2	JJY	Tokyo (Sanwa, Ibaraki), Japan	2
	a2	BSF	Chung-li, Taiwan	5
	a1	RTA	Novosibirsk, USSR	5
	a3	WWV	Fort Collins, Colorado	10
15,004	a1	RID	Irkutsk, USSR	1

This book is a distillation of the International Frequency List prepared by the International Telecommunications Union (ITU), plus other listings submitted by listeners. This 224 page book lists for $9.95, is published by Gilfer Associates, and may be ordered from:

========== n o t i c e ==========

Here is a Novice study guide that I have prepared. Some of the answers may not be the best. If you have better or alternatively worded answers please let me know of them and I will correct the original.

tnx, Paul

Rules and Regulations

2A-1.1 What is the Amateur Radio Service?

A: A radio communication service of self-training, intercommunication, and technical investigation carried on by amateur radio operators.

2A-2.1 Who is an amateur radio operator?

A: A person holding a valid license to operate an amateur radio station issued by the Federal Communications Commission.

2A-3.1 What is an amateur radio station?

A: A station licensed in the amateur radio service embracing necessary apparatus at a particular location used for amateur radio communication.

2A-4.1 What is amateur radio-communications?

A: Non-commercial radio communication by or among amateur radio stations solely with a personal aim and without pecuniary or business interest.

2A-5.1 What is that portion of an amateur radio license that conveys operator privileges called?

A: Operator's license.

2A-6.1 What authority is derived from an amateur radio station license?

A: Authorization for a radio station in the Amateur Radio Service.

2A-7.1 What is a control operator?

A: An amateur radio operator designated by the licensee of an amateur radio station to also be responsible for the emissions from that station.

2A-7.2 What is the term used in Part 97 of the FCC Rules to define the amateur radio operator designated by the licensee of an amateur radio station to also be responsible for the emissions from that station?

A: Control operator.

2A-8.1 What is third-party traffic?

A: Amateur radio communication by or under the supervision of the control operator at an amateur radio station to another amateur radio station on behalf of anyone other than the control operator.

2A-8.2 Who is a third-party in amateur radio communications?

A: Anyone other than the control operator.

2A-9.1 What are the Novice class operator transmitting frequency privileges in

the 80 meter band?

A: 3700 to 3750 KHz

2A-9.2 What are the Novice class operator transmitting frequency privileges in the 40 meter band?

A: 7100 to 7150 KHz

2A-9.3 What are the Novice class operator transmitting frequency privileges in the 15 meter band?

A: 21100 to 21200 KHz

2A-9.4 What are the Novice class operator transmitting frequency privileges in the 10 meter band?

A: 28100 to 28200 KHz

2A-9.5 What, if any, transmitting frequency privileges are authorized to the Novice class operator besides those in the 80, 40, 15 and 10 meter bands?

A: None.

2A-9.6 In what frequency bands is a Novice class operator authorized to be the control operator of an amateur radio station?

A: 80, 40, 15, and 10 meter bands.

2A-9.7 What does the term frequency band

mean?

A: All frequencies that fall between and upper and lower frequency limit.

2A-9.8 What does the term frequency privilege mean?

A: Frequencies where operation of an amateur radio station is permitted.

2A-9.9 In what frequency band is the Novice

class operator transmitting frequency privileges 3700-3750 KHz?

A: 80 meter band.

2A-9.10 In what frequency band is the Novice class operator transmitting frequency privileges 7100-7150 KHz?

A: 40 meter band.

2A-10.1 What is the only emission authorized for use by Novice class operators?

A: A1, C.W., international morse code.

2A-10.2 What does the term A1 emission mean?

A: Sending signals by turning a transmitter on and off. Also known as on-off keying.

2A-10.3 What is the symbol for a transmission of telegraphy by on-off keying?

A: A1

2A-10.4 What does the term CW mean?

A: Continuous wave. Transmission of

signals by letting a transmitter send a continuous wave or turning it off. This might be accomplished by connecting a telegraph key to the "send" control of a transmitter.

2A-10.5 What, if any, emission privileges are authorized to the Novice class beside A1?

A: None

2A-10.6 What is the only telegraphy code a Novice class operator may use?

A: international Morse code.

2A-10.7 Which, if any, telegraphy codes may a Novice class operator use beside the international Morse code?

A: None

2A-10.8 What does the term emission mean?

A: emission refers to the type or nature of a transmitted signal.

2A-10.9 What is the term for a transmission from a radio station, as used in the FCC Rules?

A: emission

2A-10.10 What does the term emission privileges mean?

A: This refers to what emissions a station is allowed to use.

2A-11.1 Under what circumstances, if any, may the control operator cause unidentified radio-communications or signals to be transmitted from an amateur radio station?

A: None

2A-11.2 What is the meaning of the term unidentified radio-communications or signals?

A: Signals that do not use FCC approved call signs.

2A-11.3 What is the term for transmissions from an amateur radio station without the required station identification?

A: Unidentified radio-communications or signals.

2A-12.1 Under what circumstances, if any, may the control operator of an amateur radio station willfully or maliciously interfere with or cause interference to a radio-communication or signal?

A: None

2A-12.2 What is the term for transmissions from an amateur radio station which are intended by the control operator to disrupt other communications in

progress?

A: Malicious interference

2A-13.1 Under what circumstances, if any, may the control operator cause false or deceptive signals or communications to be transmitted?

A: None

2A-13.2 What is the term for a transmission from an amateur radio station of the word MAYDAY when no actual emergency has occurred?

A: False or deceptive

2A14.1 Under what circumstances, if any, may an amateur radio station be used to transmit messages for hire?

A: None

2A-14.2 Under what circumstances, if any, may the control operator be paid to transmit messages from an amateur radio station?

A: None

2A-15.1 What is one of the five principles which express the fundamental purpose for which the Rules for the Amateur Radio Service are designed?

A: Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.

2A-20.1 Call sings of amateur radio stations licensed to Novice class operators are from which call sign group?

A: Group D

2A-20.2 What is the format of a group D call sing?

A: two letters a number and three letters

2A-20.3 What are the call sign prefixes for

amateur radio stations licensed by the FCC

A: AA to AM, K, N, and W

2A-20.4 In what call sign district will your amateur radio call sing be assigned?

A: That depends on your mailing address. For those in New York and New Jersey the district is number 2.

2A-21.1 With which amateur radio stations may an FCC-licensed amateur radio station communicate?

A: Only with other amateur radio stations.

2A-21.2 With which non-amateur radio stations may an FCC-licensed amateur radio station communicate?

A: None, except in an emergency.

2A-21.3 Under what circumstances may an FCC-licensed amateur radio station communicate with another amateur radio station in a foreign country?

A: Only when the each country's government permits international communications by their respective amateur operators. (this is usually the case)

2A-21.4 Under what circumstances (other than RACES operation) may an FCC-licensed amateur radio station communicate with a non-amateur radio station?

A: None, except in an emergency.

2A-21.5 What is the term used in FCC Rules to describe transmitting signals to receiving apparatus while in beacon or radio control operation?

A: One way communications.

2A-23.1 How often must an amateur radio station be identified?

A: At the beginning and end of every transmission or exchange of transmissions. Also, every 10 minutes for transmission longer than 10 minutes.

2A-23.2 How do I identify my amateur radio station communications?

A: send the letters "DE" followed by your FCC assigned call letters.

2A-23.3 Do the FCC Rules require an amateur radio station to identify at the beginning of a transmission?

A: Yes

2A-23.4 duplicate question of 2A23.1

2A-23.5 What is the FCC Rule for amateur radio station identification?

A: identification is required at the beginning and end of each transmission or exchange of transmissions. Plus, for transmissions longer than 10 minutes, identification must be given every 10 minutes.

2A-23.6 What is the least number of times an amateur radio station must transmit its station identification during a 15 minute communication?

A: 3 times: When starting, 10 minutes into the transmission, and at the end.

2A-23.7 What is the least number of times an amateur radio station must transmit its station identification during a 25 minute communication?

A: 4 times: When starting, 10 minutes into the transmission, 20 minutes into the transmission, and at the

end.

2A-23.8 What is the least number of times an amateur radio station must transmit its station identification during a

35 minute communication?

A: 5 times: When starting, 10 minutes into the transmission, 20 minutes into the transmission, 30 minutes into the transmission, and at the end.

2A-23.9 What is the longest period of time during a communication that an amateur radio station does not need to transmit its station identification?

A: 10 minutes

2A-23.10 What is the least number of times an amateur radio station must identify itself during a 5 minute communication.

A: twice: at the beginning and at the end.

2A-24.1 What amount of transmitter power may

an amateur radio station use?

A: The rule here has recently changed. The correct answer is 1500 Watts peak output power.

2A-24.2 What is the maximum transmitter power input permitted to be used at an amateur radio station transmitting on frequencies available to the Novice class operator?

A: 250 Watts input. 200 Watts output.

2A-24.3 In what circuit stage in an amateur radio station transmitter is power input determined?

A: Final amplifying radio frequency stage.

2A-24.4 Which individual circuit power inputs must be included in determining the total power input to the final amplifying radio frequency stage to the antenna?

A: all radio frequency inputs

2A-25.1 Should an amateur radio operator receive an Official Notice of Violation from the FCC, how promptly should he/she respond.

A: 10 days.

2A-25.2 Should an amateur radio operator receive an Official Notice of Violation from the FCC, to whom does he/she respond?

A: To the office that originated the Notice.

2A-25.3 Should an amateur radio operator receive an Official Notice of Violation from the FCC relating to some violation that may be due to the physical or electrical characteristic of the transmitting apparatus, what information must be included in the response?

A: It should indicate what steps have or will be taken to correct the problem. If the correction will take place in the future, a scheduled date of the

correction must be included.

2A-26.1 Whom does the FCC hold responsible

for the proper operation of an amateur radio station?

A: Station licensee.

2A-26.2 When must an amateur radio station have a control operator?

A: Always, unless the station is operated under automatic control.

2A-26.3 Who may be the control operator of an amateur radio station?

A: The control operator may be the station licensee, if a licensed amateur radio operator, or may be another amateur radio operator with the required class of licensee.

OPERATING PROCEDURES

2B-1.1 What does the R in the RST signal report mean?

A: Readability

2B-1.2 What does the S in the RST signal report mean?

A: Strength

2B-1.3 What does the T in the RST signal report mean?

A: Tone

2B-2.1 At what telegraphy speed should a CQ message be transmitted?

A: At a speed you would like to receive a response.

2B-3.2 Why should amateur radio stations in communication with each other zero beat?

A: So that they will both transmit on the same frequency.

2B-4.1 How can on-the-air transmitter tune-up be kept as short as possible.

A: By using a dummy load antenna for initial adjustments

2B-5.1 What is the difference between the telegraphy abbreviation CQ and QRZ?

A: CQ means "anyone please reply." QRZ means "who is calling me?"

2B-5.2 What is the difference between the telegraphy abbreviation K and SK?

A: K means "go ahead." SK means "I have finished, no reply is expected."

2B-5.3.1 What is the meaning of the telegraphy abbreviation DE.

A: DE means "from."

2B-5.3.2 What is the meaning of the telegraphy abbreviation R.

A: R means "I acknowledge receipt of your message."

2B-5.3.3 What is the meaning of the telegraphy abbreviation AR.

A: AR means "end of message."

2B-5.3.4 What is the meaning of the telegraphy abbreviation 73.

A: 73 means "best regards."

2B-5.3.5 What is the meaning of the telegraphy abbreviation QRS.

A: QRS means "please send more slowly."

2B-5.3.6 What is the meaning of the telegraphy

abbreviation QTH.

A: QTH means "my location is."

2B-5.3.7 What is the meaning of the telegraphy abbreviation QSL.

A: QSL means "I acknowledge receipt of your message."

2B-5.3.8 What is the meaning of the telegraphy abbreviation QRM.

A: QRM means "I am being interfered with".

2B-5.3.9 What is the meaning of the telegraphy abbreviation QRN.

A: QRN means "I am troubled by static."

Radio Wave Propagation

2C-1.1 What type of propagation uses radio

signals refracted back to earth by the ionosphere?

A: Skip propagation.

2C-1.2 What is the meaning of the term skip propagation?

A: radio waves that are refracted (or skipped) back to earth by the ionosphere.

2C-1.3 What is the area of weak signals between the ranges of ground waves and the first-hop called?

A: skip zone.

2C-1.4 What is the meaning of the term skip zone?

A: It is the area of weak signals between the ranges of ground waves and the first-hop.

2C-1.5 What does the term skip mean?

A: signals that are bounced off the ionosphere back to earth

2C-1.6 What type of radio wave propagation makes it possible for amateur radio stations to communicate long

distances?

A: skip propagation

2C-2.1 What type of propagation involves radio signals that travel along the ground?

A: ground wave

2C-2.2 What is the meaning of the term ground wave propagation?

A: radio signals that travel along the ground

2C-2.3 When two amateur radio station located a few miles apart are separated by a low hill blocking their line-of-sight path, daytime communications between them on 3.725 MHz is probably via what kind of propagation?

A: ground wave

2C-2.4 When compared to skip propagation, what is the usual effective range of ground wave propagation.

A: much shorter

Amateur Radio Practice

2D-1.1 How can an amateur radio station be protected against being operated by unauthorized persons?

A: Lock the room that contains the equipment.

2D-2.1 Why should all antenna and rotor cables be grounded when an amateur radio station is not in use?

A: to reduce shock hazard from lightning.

2D-2.2 How can an antenna system be protected from damage due a to nearby lightning strike?

A: By grounding the antenna system when not in use.

2D-2.3 How can an amateur radio station

equipment be protected from damage due to lightning striking the electrical wiring in the building?

A: by unplugging it from the electrical outlet when not in use

2D-3.1 For proper protection from lightning strikes, what pieces of equipment should be grounded in an amateur radio station?

A: anything that can conduct electricity.

2D-3.2 What is a convenient indoor grounding point for an amateur radio station?

A: a cold water pipe.

2D-3.3 To protect against electrical shock hazards, the chassis of each equipment in an amateur radio station should be connected to what?

A: ground

2D-4.1 When working on an antenna mounted on a tower, a person doing the climbing should always wear what type of safety equipment?

A: a safety belt.

2D-4.2 For safety purposes, how high should all portions of a horizontal wire antenna be located?

A: high enough so that it won't pose a hazard to people or vehicles.

2D-4.3 What type of safety equipment should a person on the ground wear while assisting another person on an antenna tower?

A: a hard-hat.

2D-5.1 What is a likely indication that radio frequency interference to a receiver is caused by front-end overload?

A: interference is present regardless of the frequency that the receiver is tuned to.

2D-5.2 When radio frequency interference occurs to a receiver regardless of frequency, while an amateur radio station is transmitting, what is likely the problem?

A: front-end overload

2D-5.3 What type of filter should be installed on a television receiver's tuner input as the first step in preventing overload from an amateur radio station's signal?

A: a high pass filter

2D-5.4 What is meant by receiver overload?

A: the receiver hears signals that are too strong for it (these signals may be on frequencies other that what the receiver is tuned to).

2D-6.1 What is meant by harmonic radiation?

A: radiation (or transmission) of energy on frequencies that are integer multiples of the intended signal.

2D-6.2 Why is harmonic radiation by an amateur radio station undesirable?

A: causes interference

2D-6.3 A multi-band antenna connected to an improperly tuned transmitter may radiate what type of interference?

A: harmonic radiation

2D-6.4 What is the purpose of properly shielding a transmitter?

A: to prevent spurious radiation

2D-6.5 When interference is observed on only one or two channels of a TV receiver while an amateur radio station is transmitting, what is the likely problem.

A: harmonic radiation

2D-6.6 What type of filter should be installed on an amateur radio transmitter as the first step in reducing harmonic radiation?

A: low pass

2D-7.1 Why is it important to have the impedance of a transmitter final amplifier circuit match the impedance of the antenna or feedline?

A: so that SWR will be minimum

2D-7.2 What is the term for the measurement of the impedance match between a transmitter final amplifier circuit and the antenna or feedline?

A: One measurement would be standing wave ratio or SWR.

2D-7.3 What station accessory is used to measure RF power being reflected back

down the feedline from the antenna to

the transmitter.

A: directional watt meter or SWR meter

2D-7.4 What station accessory is often used to measure voltage standing wave ratio?

A: SWR bridge

2D-7.5 Where should an SWR bridge be connected to indicate the impedance match of a transmitter and an antenna.

A: Either between the transmitter and the feedline or between the feedline and the antenna (latter is best).

2D-7.6 Coaxial feedlines are designed to be operated with what kind of standing wave radio?

A: low or 1:1

2D-7.7 If the SWR bridge reading is higher

at 3700 KHz than at 3750 KHz, what does this indicate about the antenna?

A: It provides a better match at 3750 KHz than at 3700 KHz.

2D-7.8 If the SWR bridge reading is lower at 3700 KHz than at 3750 kHz, what does this indicate about the antenna?

A: It provides a better match at 3700 KHz than at 3750 KHz.

2D-8.1 What kind of SWR meter reading may indicate poor electrical contact between parts of an antenna system?

A: unusually high (more than 4:1)

2D-8.2 High SWR readings measured from a half-wave dipole antenna being fed by coaxial cable can be lowered by doing what to the antenna?

A: changing its length

Electrical Principles

2E-1.1 Electrons will flow in a copper wire when its two ends are connected to the poles of what kind of source?

A: a current or voltage source

2E-1.2 The pressure in a water pipe is comparable to what force in an electrical circuit?

A: voltage

2E-2.1 What are the two polarities of a voltage?

A: positive and negative

2E-2.2 What type of current changes direction over and over again in a cyclical manner?

A: alternating current

2E-2.3 What is a type of electrical current called that does not periodically reverse direction?

A: direct current

2E-3.1 List at least four good electrical insulating materials.

A: glass, plastic, rubber, mica

2E-3.2 List at least three good electrical conductors.

A: silver, gold, aluminum

2E-3.3 What is the term for the lowest voltage which will cause current in an insulator?

A: break-down voltage

2E-4.1 What is the term for a failure in an electrical circuit that causes excessively high current?

A: a short circuit

2E-4.2 What is the term for an electrical circuit in which there can be no current flow?

A: an open circuit

2E-5.1 When a voltage is applied to a circuit causing an electrical current to flow, what is consumed?

A: Power or Energy

2E-6.1 What is the approximate length, in meters, of a radio wave having a frequency of 3.725 MHz?

A: 300/3.725 = 80.5 meters

2E-6.2 What is the relationship between

frequency and wavelength?

A: inversely proportional OR speed = wavelength times frequency.

2E-6.3 What is the approximate length, in meters, of a radio wave having a frequency of 21.120 MHz?

A: 300/21.120 = 14.2 meters

2E-7.1 Which are higher: radio frequencies or audio frequencies?

A: radio

2E-7.2 Is 3,500,000 Hertz a radio frequency or an audio frequency?

A: radio

2E-7.3 Radio frequencies are considered to be those above what frequency?

A: 30 KHz

2E-8.1 Are audio frequencies higher or lower than radio frequencies?

A: lower

2E-8.2 Audio frequencies are considered to be those below what frequency?

A: 30 KHz

2E-8.3 what frequency range is 2500 Hertz: audio or radio?

A: audio

2E-9.1 What is the unit of electromotive force?

A: Volt

2E-10.1 What is the unit of electrical current?

A: Ampere

2E-11.1 What is the unit of electrical power?

A: Watt

2E-12.1 What is Hertz the unit measurement of?

A: frequency

2E-12.2 What is another popular term for Hertz?

A: cycles-per-second

2E-13.1 A frequency of 40,000 Hertz is equal to how many kilohertz?

A: 40 KHz

2E-13.2 A current of 20 millionths of an ampere is equal to how many

microamperes.

A: 20 microamperes

2E-13.3 A current of 2000 milliamperes is equivalent to how many amperes?

A: 2 amperes

2E-13.4 What do the prefixes mega and centi mean?

A: Mega is million and Centi is hundredth.

2E-13.5 What do the prefixes micro and pico mean?

A: Micro is millionths and pico is million-millionths.

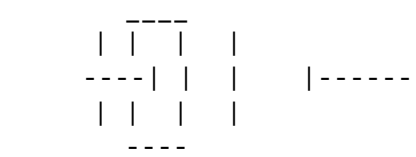
Circuit Components

2F-1.1 What is the general relationship between the thickness of a quartz crystal and its fundamental operating frequency?

A: As the crystal becomes thinner and thinner, the frequency becomes higher and higher.

2F-1.2 What is the schematic symbol for a quartz crystal?

A:



2F-1.3 What chief advantage does a crystal controlled transmitter have over one controlled by a variable frequency oscillator?

A: Crystal controlled will be much more stable in frequency

2F-2.1 What two internal components of a D'Arsonval meter interact to cause the indicating needle to move when current flow through the meter?

A: A permanent magnet and an electro-magnet

2F-2.2 What does a voltmeter measure?

A: voltage

2F-3.1 Draw the schematic diagram of a triode vacuum tube and label the elements.

A:

2F-3.2 Draw the schematic symbol for a tetrode vacuum tube and label the elements.

A:

2F-3.3 What was one of the earliest uses of a two-element vacuum tube?

A: rectifier or diode to convert AC to DC

2F-4.1 What device should be included in electronic equipment to protect it from damage resulting from a short circuit?

A: a fuse

Practical Circuits

2G-1.1 Draw a block diagram for a simple crystal controlled transmitter.

A:

2G-1.2 Draw a block diagram for a simple transmitter having a variable frequency oscillator.

A:

2G-2.1 Draw a block diagram for a simple superheterodyne receiver capable of receiving A1 telegraphy radio signals.

A:

2G-3.1 Draw a block diagram for a portion of an amateur radio station including a transmitter, an antenna feedline, an antenna and an SWR bridge.

A:

2G-3.2 Draw a block diagram for a portion of an amateur radio station including a transmitter, a receiver, a T-R switch, an antenna feedline and an antenna.

A:

2G-3.3 Draw a block diagram for a portion of an amateur radio station including a transmitter, an antenna tuner, an antenna feedline and an antenna.

A:

2G-3.4 Draw a block diagram for a portion of an amateur radio station including a transmitter, telegraphy key, antenna

feedline and antenna.

A:

2G-3.5 Draw a block diagram for a portion of an amateur radio station showing how two different antennas and a dummy antenna can be switched to the same transmitter.

A:

2G-3.6 Draw a block diagram for a portion of amateur radio station including a transmitter, an SWR meter, an antenna tuner, an antenna feedline and an antenna.

A:

2G-3.7 Draw a block diagram for a typical Novice station including a transmitter, a receiver, an antenna feedline, an antenna, a T-R switch, grounding provisions and a telegraph

key.

A:

Signals and Emissions

2H-1.1 An interrupted carrier wave is considered to be which type of emission?

A: Continuous wave or CW

2H-2.1 What does the term backwave mean?

A: backwave is a signal heard in a receiver after a transmitter is de-energized. This is caused when a transmitter continues to output energy when the receiver becomes activated

2H-2.2 What is a possible cause of backwave.

A: improper transmit-receive switching circuitry operation.

2H-3.1 What does the term key clicks mean?

A: clicks generated by a transmitter when the key is opened or closed.

2H-3.2 How can key clicks be eliminated?

A: With a key click filter

2H-4.1 What does the term chirp mean?

A: Frequency shift of a transmitter when the key is closed.

2H-4.2 What can be done to a telegraph transmitter's power supply to avoid chirp.

A: ensure that it has good voltage regulation

2H-5.1 What is a common cause of superimposed hum?

A: poor transmitter power supply filtering.

2H-6.1 A signal received on 28.160 MHz is the 4th harmonic of what fundamental frequency?

A: 28.160/4 = 7.040 MHz

2H-7. Spurious emissions from a transmitter may be caused by what problem in the power amplifier stage?

A: over-drive or improper neutralization.

Antennas and Feedlines

2I-1.1 What is the approximate total length in feet of a half-wave dipole antenna cut for 3725 KHz?

A: (300/3.725) * 3.28 *(1/2) = 132 ft.

2I-1.2 What is the approximate total length in feet of a half-wave dipole antenna cut for 7125 KHz?

A: (300/7.125) * 3.28 *(1/2) = 61.9 ft.

2I-1.3 What is the approximate total length in feet of a half-wave dipole antenna cut for 21125 KHz?

A: (300/21.125) * 3.28 * (1/2) = 23.3 ft.

2I-1.4 What is the approximate total length in feet of a half-wave dipole antenna cut for 28150 KHz?

A: (300/28.150) * 3.28 * (1/2) = 17.5 ft.

2I-1.5 How is the approximate total length in feet of a half-wave dipole antenna calculated?

A: determine the total length of a one wave and divide by 2.

2I-2.1 What is the approximate total length in feet of a quarter-wave vertical antenna adjusted to resonate at 3725

KHz?

A: (300/3.725) * 3.28 *(1/4) = 66 ft.

2I-2.2 What is the approximate total length in feet of a quarter-wave vertical antenna adjusted to resonate at 7125 KHz?

A: (300/7.125) * 3.28 *(1/4) = 34.5 ft.

2I-2.3 What is the approximate total length in feet of a quarter-wave vertical antenna adjusted to resonate at 21125 KHz?

A: (300/21.125) * 3.28 * (1/4) = 11.6 ft.

2I-2.4 What is the approximate total length in feet of a quarter-wave vertical antenna adjusted to resonate at 28250 KHz?

A: (300/28.250) * 3.28 * (1/4) = 8.7 ft.

2I-2.5 When a vertical antenna is lengthened, what happens to its resonant frequency?

A: As with most common antennas, when they are lengthened, the resonant frequency decreases.

2I-3.1 What is coaxial cable.

A: cable constructed of a center conductor encased in insulation, which is then covered by an outer conducting shield and weatherproof jacket.

2I-3.2 What kind of antenna feedline is constructed of a center conductor encased in insulation, which is then covered by an outer conducting shield and weatherproof jacket?

A: coaxial cable.

2I-3.3 What are some advantages in using coaxial cable as an antenna feedline?

A: can be located near other metal objects, can be buried.

2I-3.4 What commonly available antenna feedline can be buried directly in the ground for some distance without adverse effects?

A: coaxial cable

2I-3.5 When an antenna feedline must be located near grounded metal objects, which commonly available feedline should be used?

A: coaxial cable

2I-4.1 What is parallel conductor feedline?

A: feedline constructed of two conductors maintained a uniform distance apart by insulated spreaders.

2I-4.2 Can an amateur radio station use TV antenna "twin lead" as a feedline?

A: Yes

2I-4.3 What are some advantages in using a parallel conductor feedline?

A: very low loss, can be home-made.

2I-4.4 What are some disadvantages in using a parallel conductor feedline?

A: can't be buried or used near grounded metal objects.

2I-4.5 What kind of antenna feedline is constructed of two conductors maintained a uniform distance apart by insulated spreaders?

A: parallel conductor feedline

to all radio amateurs bt

space shuttle sts9 launch is now scheduled for november 28 at 1600
utc. no ham transmissions should be expected from w5lfl before the
third day of the mission, wednesday, november 30. astronaut
garriotts original operating schedule has changed because a
substantial number of spacecraft attitude changes have been caused by
the launch delay. though specific times and locations are not yet
known, possible times for operation over the u.s. and canada could be
from 1300 to 1500 utc along the u.s. east coast, from 0100 to 0300
utc along the u.s. west coast, and on the final full day in orbit,
december 6, between 1300 and 0300 utc. more detailed information
will be reported as soon as it is released.

a recent announcement states that though w5lfl will not be available for hamming while engaged in experimental activities, he will occasionally leave his receiver set on one of the ten preselected frequencies while crossing the u.s. for these ten minutes or so, incoming calls will be tape recorded and played back later on the ground. calls in the blind should be made for no longer than 30 seconds near closest approach to give more hams a chance to be heard. which one of the ten preselected frequencies will be used will not be announced ar

to all radio amateurs bt

active areas of the sun that were responsible for the solar flux rise
in early october are facing the earth again. sunspot counts are far
below those of four weeks ago, and the solar flux high for november
is only 107 thus far. at the same sun position in october the flux
was 134 and rising. some further rise is expected in the next few
days, but anything approaching the october high of 140 now seems
unlikely.

november is traditionally a month of high muf and generally good
conditions on all dx frequencies, however, and prospects look good
for november 6 through 9, 16, 17, and 22 to 24. fairly severe
disturbances and possible auroral conditions in northern u.s. and
adjacent canadian areas are expected november 10 through 15, 18 to 21
and 25 to 30.

american sunspot numbers for october 27 through november 2 were
between 1 and 20 with a mean of 11.4 ar

FCC Drastically Reduces Ham Testing

The days are numbered for those applicants who simply want to walk into an FCC facility and take a Commission administered amateur radio examination.

The FCC Field Operations Bureau has issued an internal mimeographed memorandum indicating that amateur radio examinations given at all District FCC Offices throughout the country will be limited to a total of four during calendar year 1984. The author of the memo was the FCC's Field Operations Bureau Chief, Richard M. Smith.

The internal notice is now in the process of being printed and will be distributed shortly. No examinations will be given by the Commission (either at regular testing points or at remote locations) more often than quarterly. An appointment must be requested in advance. Needless to say, the opportunity for upgrading will be drastically reduced next year.

The examinations will be offered at FCC Field Offices during these periods:

Quarter Testing Dates ------- -------------
1 February 6 through 10, 1984
(Applications received by January 15).

2 May 7 through 11, 1984
(Applications received by April 15).

3 August 6 through 10, 1984
(Applications received by July 15).

4 November 5 through 9, 1984
(Applications received by October 15).

All FCC facilities will give both the commercial and amateur examinations on those dates. Amateurs should submit their Form 610 applications at least one month in afvance of the above dates if they want to take a particular examination. If the situation warrants, more than one day will be scheduled for testing during the above periods.

It is my understanding that the FCC will be looking for a free facility other than their current testing rooms to hold the exams because their offices would not be large enough to accomodate the large number of anticipated applicants.

While field offices have not received instructions regarding any correlation between the new FCC testing program

and the volunteer examination procedures recently approved by the Commission, the FCC feels that these will be numerous other testing opportunities at hamfests and other volunteer supervised examination sessions. ''We are working very closely with the Private Radio bureau to get that thing moving.''

FOLLOWING FROM NOVEMBER 10 ISSUE OF ARRL LETTER

10 METER ALLOCATIONS...

THE FCC RELEASED AN ORDER NOVEMBER 2 DECLINING TO ALLOCATE ADDITIONAL FREQUENCIES FOR TEN METER REPEATERS, PR DOCKET 83-483. THE DENIAL WAS BASED ON THE ADVERSE IMPACT WHICH COULD OCCUR TO OTHER OPERATIONS, PARTICULARLY AMATEUR SATELLITES, AND UPON THE LACK OF A COMPELLING NEED. AS AUTHORIZED BY THE ARRL EXECUTIVE COMMITTEE, ARRL HAD FILED COMMENTS IN JULY REQUESTING DENIAL BASED ON SIMILAR REASONING. SEE ARRL LTR VOL 2 NR 16 AND OCT 1983 QST P60.

A marketing representative from Electra, manufacturer of Bearcat scanners, spoke at a recent scanner club meeting. He had some interesting comments:

o+ Bearcat manufacturing facilities were moved to Puerto Rico a month ago.

o+ Some Bearcat crystal controlled portable scanners are manufactured by Sanyo.

o+ Bearcat will not offer 800 MHz capability in a scanner until they can be assured of at least 10,000 sales.

o+ A new scanner/computer product will be announced in 1Q84. (Could this be a scanner with a computer interface?)

o+ Bearcat can no longer repair BC-101 scanners because the automatic test equipment used for troubleshooting this model broke down, and "is not worth fixing." Since a federal law requires manufacturers to repair or replace their products for a 7 year period after manufacture, BC-101 owners are being offered a trade in allowance on a new BC-250.

o+ SCAN Magazine, published by an advertising agency hired by Electra, will probably cease publication soon, as Electra is firing this agency.

o+ Electra interviewed several state police officers to determine what features they deemed most valuable in a scanner. This resulted in the new BC-260 mobile scanner. Its size permits mounting in a standard Motorola mounting bracket under the dashboard, and has 3 watts of audio output.

o+ The BC-220 is still being offered, but on a limited basis.

o+ The BC-250, although a current model, has not been manufactured for a while, because of large inventories.

o+ Newer BC-100's (the portable synthesized model) have the following improvements:

a. BNC antenna connector, which replaces the threaded type.
b. Fewer "birdies."
c. Greater sensitivity.
d. More audio output.
e. Four new chassis reinforcements. Owners of older BC-100s complained that the batteries would temporarily disconnect when the unit was jarred. Needless to say, this wiped out the contents of memory.

o+ Bearcat scanners will be sold at Ace Hardware stores.

o+ The lowest scanner prices may be found in places like Service Merchandise (BC-210XL < $200, BC-100 < $300).

Here is a note of interest to members of large employer
sponsered radio clubs from Steve Ewald of ARRL.

Begining December 1st, 1983, the rule that an employee of
a company may not administer a novice exam to another employee

of the same company will be dropped. All other constraints
remain the same.

x
       A friend   in N.J., KC2KO,   once related his experiences with a
       new Dentron Clipperton-V 2 meter amplifier, purchased from
       Amateur   Electronics Supply (AES) in   Milwaukee.   This
       SSB/CW/RTTY/FM amp was   advertised by Dentron and AES as a
       500 watt   input unit. It   used a single 4CX-250B and required
       between 10 and 25 watts drive.

       In addition to experiencing bizarre   amplifier   input
       impedances, this fellow could   never   run the
     unit at 500
       watts input without it blowing up. It was sent back to
     the
       factory   for repair, but still wouldn't run at the rated
       input.

       Finally,   a Dentron engineer confessed that the
     Clipperton-
       V's design made it IMPOSSIBLE to   run 500 watts input without
       self-destructing! KC2KO wrote letters to AES, Dentron,
     and
       the Attorney General's office, claiming false advertising,
       and demanding a full refund. He   got one.

The Fall 1983 AES catalog contains a closeout advertisement on page 43 for this amplifier, reduced from $699 to $299! These units are new, not used. Beware, there is an interesting footnote in the ad:

> "This unit is being offered at this low price on an "as-is" basis with No Factory or AES Warranty and No Returns; all sales are final! Consider this purchase only if your [sic] have the technical expertise to perform any possible repairs and/or modifications on this type of equipment."

There are other Dentron items advertised on the same page, but they all carry a 90 day AES warranty. The Clipperton-V must have been a super lemon.

I just purchased the Dentron power supply listed in the new AES catalog. This is the supply that was used to power the Dentron transciever. It was a $129 unit now being sold for $39.

The specs are not too clear in the ad. The regulated output is only good for 2 amps. The high current output is unregulated and puts out 17.5 volts unloaded and drops to about 13 or so with a 16 amp load. The transformer is supposed to be rated

for 20 amps. Unfortunately, there is little room to add heat
sinks large enough to permit regularing the high current output
without mounting them on top of the cabinet.
I guess it is still worth the sale price, but not what I expected.

hr dx bulletin nr 45 from arrl headquarters
newington ct november 18, 1983
to all radio amateurs bt

thanks to k1xm, k1mm and w1trc of the southern new england dx
association for the following dx information.

cameroon. tj1af is back in cameroon and has been heard around 21287
khz at 1900z.

ghana. el2z will be stationed permanently in 9g1 starting january 1.
his license status is uncertain.

nepal. yb5aso plans to be in 9n2 next week, and will try to be
active on cw.

seychelles. s79sm has been active on 20 cw about 1800z at about
14018 khz. qsl box 84, mahe, seychelles.

bahrain. walt, a92dt, has been on fairly regularly at 1200z at about
21295 khz.

the colvins. lloyd and iris are still on from w6kg/hk0, san andres.
qsl via the yasme foundation.

160 meters. between 0300 and 0500z, lz1kdp, uk2gab, fc9vn and ct1aoz

have been worked on 160.

tuvalu. t2gsh has been active at about 1200z around 3795 khz, and has been joined by other stations including yj8rg and zk1gc.

k1mm schedule. through november 20, bill will be at vs6im. between the 20th and 30th he will be near by1pk where he hopes to operate, december 2 and 3 near by8aa where he also hopes to operate, and the 4th and 5th at vs6im again.

lord howe island. vk2bqq/lh will be active november 23 through 29 on 3501, 7001, 14030, 21030 and 28030 khz cw and 14210 khz on ssb. operation is also possible on 160 and 30 meters. qsl to box 2309, sydney 2001, australia. remember, 30 meter contacts do not count toward dxcc.

belize. six operators from the kansas city dx club will be active from november 23 to 29. the call v3a will be used for the cq ww contest, and individual calls have been applied for. qsls go to kb0g.

special event station. ref of france will operate to8ab, in commemoration of the 60th anniversary of the first transatlantic qso, from 1800z november 23 to 0700z the 24th, on 3777 khz ar

They've changed the number to 900-410-TIME. Turns out that the amount
of calls received on their wats ran their bill up to slightly over the
national debt. So they're letting the public foot the bill.

- Grenada and Ham Radio - What Really Happened!

The week of October 24th was to have been a very special one for amateur radio. It was delayed only to be outdone by another precedent setting ham radio spectacular... Grenada. It caught most ham operators by surprise and much misinformation exists. What follows is a researched account of amateur radio involvement in the Grenadian invasion and evacuation.

The chancellor of the Grenada St. George's Medical School heard a news report describing the invasion of the island of Grenada, West Indies. Concerned with the safety of hundreds of American students, he quickly telephoned Dick Zaretsky (WB2VGL/4) of West Palm Beach, Florida, with a request to establish contact with amateurs at the medical facility. They had previously arranged that Dick would go on the air in the event of trouble.

Dick hadn't operated HF ham radio since the early 1970's but set up a station specifically to operate with Grenada in the event of an emergency. It was set up just the week end before the invasion but due to a defective relay, couldn't be used. He arranged with WA2HOC/4 and WA2HOD/4 (James and Janet Nunziato of Jupiter, Florida) to assist with an HF link and via a 2 meter autopatch hooked Grenada into St. George's University in New York who had already been contacted by another amateur, K4DMK (Jack Mays of Folkston, Georgia).

Using the Nunziato's HF rig, Dick introduced himself to Mark Barattella (KA2ORK/4),a medical student, who recognized him from his previous involvement with the school. He told Mark that he had the New York line open to the University and would continue to keep it open. It ended up being a 36 hour phone call! Dick told Mark to drop the J3 suffix to facilitate communications.

Mark told Dick how he heard airplanes in the area. This was about 5:45 a.m. Tuesday morning, October 25th. A few minutes later Mark reported the shooting. Amateurs driving to work in West Palm Beach overheard a very interesting 2-meter net on the 147.885/285 repeater that morning as well as those listening to Mark on HF! The HF conversation remained on the two meter autopatch since the Nunziato's did not have a telephone in their ham shack.

Dick Zaretsky called the Department of State to relay to them a Radio Free Grenada transmission that he thought was coded concerning the "marriage of certain students that occurred at 6 AM that morning," the time of the invasion. None of the networks or news services knew anything about the invasion since

there was a news blackout! Reporters on the island had been taken off before the invasion and none were allowed in. The amateur radio hookup to Grenada provided the first news of it.

The Department of Defense apparently had gone to great pains to perform the invasion under cover of a news blackout and here was a ham radio eyewitness under a table with helicopters and gunfire overhead broadcasting it to the world! Needless to say, since the media was prevented from covering the invasion... radio, television and newspaper coverage of Mark Baratella's ham radio transmissions were followed very closely.

Within moments of notification of the emergency, amateur operators in key locations were activated. Special authorization (which is covered in Part 97.107) for amateur radio operation during declared emergencies was obtained through the help of Don Kay (K0IND, Delray Beach, Florida) and Jack Mays (K4DMK, Folkston, Georgia).

Because of the gravity of the situation, in-band and out-of-band frequencies were requested in order to secure the most interference free frequencies. The FCC in Washington granted the proper authorization within minutes of the request.

A vigil was conducted throughout different bands and frequencies authorized amateurs for the duration of the emergency. DUe to radio wave propagation differences, it was necessary to utilize control operators at different geographical locations and frequencies.

Mark Barattella did a magnificent job of operating under incredibly adverse conditions. Emergency power was used during the greatest portion of the time. Refueling was a problem since their personal safety was imperiled every time they ventured outside the facility. The Grand Anse campus which housed 176 Americans did not have U.S. military protection from the beginning of the invasion until the actual evacuation.

Mr. Reed Clark, of the US State Department, Grenada Task Force desk conveyed messages of great importance and received status reports from Grenada via amateur radio which was the only link between those 176 Americans isolated in a foreign country beseiged by war.

The State Department was particularly concerned with the Grenadian government in conjunction with Cuban advisers might hold the American students hostage. Evidence was found later supporting such a plan. Amateur Radio kept the State Department aware of the status of the students.

At 4:10 PM EDT, Wednesday, the 26th of October, the students at the Grand Anse facility were evacuated by US military helicopters. The actual Grenada emergency pertaining to amateur radio was then terminated thirty-six hours after its inception.

On October 28th, the ARRL released the following news bulletin, "The FCC has high praise for radio amateurs and the role they played in the recent Grenada situation. The Commission waived some of its rules to facilitate

communication by KA2ORK, Mark Baratella, and other assisting operators. In the Commission's words, (quote) 'At all times the paramount interest of this agency was the safety and welfare of the medical students on the Grenada campuses. Mr. Baratella and the amateur radio operators assisting him provided valuable services in relaying information as to the safety of the medical students and their families and as to the general situation existing at the Grenada station.' (unquote)"

- Ham Operation In and Out of Band

I had several questions that I thought should be discussed concerning the Grenada ham emergency operation and severl involved individuals were telephoned. One of those questions concerned amateur operation out of the ham band.

Mr. Bill Russell is the FCC Director of Public Affairs in Washington. He said that the State Department requested permission for voice operation in the code subband of the 20-meter band on Tuesday, October 25th. This was granted in the portion between 14.040 and 14.045 MHz. At night, out-of-band operation was granted to about six amateurs 1 KHz above the 40 and 80 meter bands dur to interference.

One of these amateurs (K4MM Bill Miller of Fairfax Station, VA) told me that this interference was principally from American amateurs. There was, however, some QRM from Spanish speaking stations - Cuba and South America. One message came across in CW, "Yankee Go Home."

The amateur operation was called the Grenada Emergency Net by the Net Control Don Kay (K0IND/4), once approval was obtained for other than standard amateur frequencies. Don Kay said he was in telephone contact with both the Department of Defense and the Pentagon during the crisis but he declined to discuss it further.

While it appears no FCC official actually gave specific permission for operation on 14.351 MHZ when the operation returned to 20 meters, the FCC decided to allow the net to continue there. The logic by the net was that since out-of-band operation was authorized on 40 and 80 meters, it must be OK to operate 1 KHz above the 20 meter band too.

I am unable to come up with the name of the FCC individual that actually gave approval for the 40 and 80 meter out-of-band operation. The approval was relayed to the net by the FCC Watch Officer in Washington through the FCC Field Office in Ft. Lauderdale. It was rumored, but never confirmed, that the FCC Chairman, Mark Fowler, was involved in the decision.

Bill Russell of the FCC said that he believed Mark Barattella probably made the 14.351 decision. Russell said that the State Department reported on the 14.351 MHz operation and the FCC said, "we don't care." The amateurs involved were told, "Just keep doing what you are doing because it is an essential service." They considered this being authorized.

The FCC cancelled all authorization for phone use of CW subbands and

non-amateur frequencies by radio amateurs on Wednesday, October 26th. On Friday morning, the FCC sent out the following electronic mail to all district Field Operations Bureau offices throughout the nation.

(Quote) "One of the objectives during the invasion of Grenada was to secure the campus of the medical school where a large number of American students were in attendance. Both the US forces and the Cuban were trying to gain the same objective. An amateur station located on the campus was apparently the only point of communication with anyone at the school and because of this, the US State Department requested a special authorization to use an amateur frequency to maintain contact with this amateur station to keep tabs on the situation at the school. Verbal authority was given for SSB use in the 14140 to 14145 KHz portion of the amateur band. This was later shifted to 7070 to 7100 KHz. Also by verbal permission, it appears that the authorization depended pretty much on what frequencies the Grenada station could work effectively without interference and would change accordingly. Ultimately, the net ended up on 14351 KHz.

While no special authorization was given for this out-of-band activity, the nature of the situation necessitated that it continue. For this reason, the Commission allowed the communications to continue and will take no enforcement action against those involved. Signed: Elliott Ours, Chief FCC Enforcement" (End Quote)

The FCC said that they received many requests from other amateur operators during the crisis to operate on the Grenada Emergency Net frequencies. They were all denied to prevent any further interference. Only about "half a dozen" amateurs were authorized to participate on other than normal amateur spectrum according to an October 28th news bulletin from the FCC.

- The Media and the Grenadian Incident

There are many sides to the ham stories in the invasion of Grenada. One of the more significant ones is the roll that the media played. The Department of Defense invaded Grenada under an imposed news blackout but private amateur radio communications were permitted. Many reported, not understanding amateur radio rules, couldn't comprehend why messahes and private conversation with Grenada was allowable but not getting status reports from these same private citizens. Some were furious to put it mildly.

The FCC Private Radio Bureau and the ARRL went over this many times with various radio, TV and newspaper reporters. They were told that they could retransmit anything they wanted since Section 605 (Secrecy provisions of the Communications Act) did not apply to amateur radio. The media was prohibited from acting as a Third Party (even though these privileges existed for one day) if they were gathering news reports.

Jim McKinney, Chief of the FCC Mass Media Bureau said that broadcasting was a professional use of amateur radio and specifically outlawed. He prohibited broadcasters from using amateur radio as a news gathering tool, a remote news pickup medium or to conduct interviews that would

be broadcast over other than the amateur service. He cited limitations in the rules about rebroadcasting from another service.

There was mass confusion as to what could and couldn't be done causing the FCC to issue a Public Notice on October 26th during the height of the invasion. IN part, the release said "...broadcasters are cautioned...that in covering amateur radio activity, they must not become actively involved in the amateur transmissions. That is to say, the broadcaster may not employ an amateur stations as it would a reporter or a translator in order to convey, directly or indirectly, questions or subject matter which the broadcast station desires to be addressed."

Furthermore, the broadcast stations were directed to advise the FCC how they had used ham radio in their news broadcasts. The media had trouble understanding that CB radio could be used as a news communications medium, but not amateur radio. Some said the administration obviously had something to hide and that the Constitution guaranteed Freedom of the Press and Speech.

Bill Miller (K4MM) one of the main US participants during the crisis said that he got a call from a CBS reporter who wanted to do a live interview via amateur radio. "I practically had to hang up on him he was so arrogant," BIll said. "I told him point blank I wouldn't do it! He kept on and on. 'USA Today' (a national newspaper) was here most of the day. The TV people wanted to come out here and I said "Be my guest." They wanted to do it live and I said you won't be able to do anything live while I'm on the air."

All across the country, radio and TV stations were showing ham operators listening to or participating in the Barattella communications. In all fairness, there was little else they could do. It was a major event and the news media was frozen out. Representatives of all three networks and one radio station reported live from the ARRL headquarters station, W1AW, for the better part of two days, according to Dave Sumner (K1ZZ), League general manager.

- FCC Drastically Reduces Ham Testing

The days are numbered for those applicants who simply want to walk into an FCC facility and take a Commission administered amateur radio examination.

The FCC Field Operations Bureau has issued an internal mimeographed memorandum indicating that amateur radio examinations given at all District FCC Offices throughout the country will be limited to a total of four during calendar year 1984. The author of the memo was the FCC's Field Operations Bureau Chief, Richard M. Smith.

The internal notice is now in the process of being printed and will be distributed shortly. No examinations will be given by the Commission (either at regular testing points or at remote locations) more often than quarterly. An appointment must be requested in advance. Needless to say, the opportunity for upgrading will be drastically reduced next year.

The examinations will be offered at FCC Field Offices during these periods:

Quarter Testing Dates
------- -------------
  1   February 6 through 10, 1984
      (Applications received by January 15).

  2   May 7 through 11, 1984
      (Applications received by April 15).

  3   August 6 through 10, 1984
      (Applications received by July 15).

  4   November 5 through 9, 1984
      (Applications received by October 15).

All FCC facilities will give both the commercial and amateur examinations on those dates. Amateurs should submit their Form 610 applications at least one month in afvance of the above dates if they want to take a particular examination. If the situation warrants, more than one day will be scheduled for testing during the above periods.

It is my understanding that the FCC will be looking for a free facility other than their current testing rooms to hold the exams because their offices would not be large enough to accomodate the large number of anticipated applicants.

While field offices have not received instructions regarding any correlation between the new FCC testing program and the volunteer examination procedures recently approved by the Commission, the FCC feels that these will be numerous other testing opportunities at hamfests and other volunteer supervised examination sessions. "We are working very closely with the Private Radio bureau to get that thing moving."

qst de ad7i
hr propagation forecast bulletin nr 46 from arrl headquarters
newington ct november 14, 1983
to all radio amateurs bt

during early november the solar flux rose gradually, to 111 on the
7th. it then turned downward, reaching a low of 92 on the 12th. it
went up two points the next day, but visual observation of the sun
has not indicated that any major upturn is imminent.

frequent geomagnetic disturbances beginning the 8th, and still with
us as this bulletin was issued, are expected to clear by the 15th,
bringing generally good propagation on all dx frequencies november 16
and 17. a longer stable period is expected about november 21.
higher solar activity and an unstable magnetic field will degrade
conditions during the 24th and for most of the balance of november.

the solar flux has been lower than at the same time in the previous
solar rotation since october 20. this will be the expected condition
more often than not for the next three years or so, but there will be
exceptions, usually brief. the 21 and 28 mhz bands have been very
good at times this month and they will be useful fairly often through
at least the next year.

american sunspot numbers for november 3 through 9 were between 42 and
94 with a mean of 62.9 ar

What are the previous Dentron Disasters implied in the subject?
I have had a MLA-2500 amp bought some years ago (to beat the FCC
ban on 10 meter linears) and have had no trouble with the little
amount that I have used it. I talked to a Dentron engineer once
and he mentioned that they run these amps at 2kw D.C. input for
an hour if they get one back with complaints about low output.
The MLA-2500 uses some of the newer technology and so they may have
been more careful than usual to get the bugs out.   The only problem
I have heard with 2500's has been power supply wipeouts caused by
the electrolytics shorting out (apparently not related to power
output, just inrush).   The main problem I have with the amp is that
seemingly everything electronic in my house goes fruitcake when the amp loads
up.

I am looking for information on ways to hook up a RTTY unit to my terminal
for receive only. I have seen many articles and adds for things that look
like they might do the job, like the AEA unit advertised in '73 Magazine,
but they don't contain enough information. (I have also sent off to the
various manufacturers, but haven't heard anything yet.) CW capabilty would
be a plus, but not essential.

I was wondering if I really need a small computer or not. I'd like to keep the costs as low as possible. Does anyone have any info or experience with these things?

Thanks In Advance,
David Sullivan, WA1TNS/2

hr arrl bulletin nr 114 from arrl headquarters
newington ct november 21, 1983
to all radio amateurs bt

the arrl committee of tellers met today to count ballots in the elections just concluded for director and vice director. the number of votes credited to each candidate is as follows. the first listed candidate is declared elected for the next term of office.

atlantic division,
   for vice director,
      george w. hippisley, k2kir 2193
      merle e. glunt, w3okn 1399
      edward j. kuebert, k3ka 794
      vincent h. bardsley, kb3om 618

delta division,
   for director,
      clyde o. hurlbert, w5ch 1301
      o. d. keaton, wa4gls 834

midwest division,
   for director,
      paul grauer, w0fir 1606
      robert s. mccaffrey, k0cy 954
      wellington b. stewart, k0si 347

pacific division,
   for director,
      william j. stevens, w6zm 1467
      robert b. vallio, w6rgg 1089
      jettie b. hill, w6rff 760
   for vice director,
      kip edwards, w6szn 1537
      frederic n. barry, k6rtu 631
      james d. knochenhauer, k6itl 573
      james a. maxwell, w6cf 565

southeastern division,
   for director,
      frank m. butler, jr., w4rh 3235
      stewart h. woodward, k4smx 1680
   for vice director
      evelyn d. gauzens, w4wyr 3361
      james a. gundry, w4jm 1512

the new directors and vice directors take office starting january 1, 1984. on that date the following candidates, previously declared elected, also take office for two year terms.

canadian director thomas b. j. atkins, ve3cdm
canadian vice director harry maclean, ve3gro

atlantic division director hugh turnbull, w3abc
dakota division director tod olson, k0to
dakota division vice director howard mark, w0ozc
delta division vice director robert p. schmidt, w5ghp
great lakes division director leonard nathanson, w8rc
great lakes division vice director george wilson, w4oyi
midwest division vice director claire richard dyas, w0jcp ar

qst de ad7i
hr propagation forecast bulletin nr 47 from arrl headquarters
newington ct november 21, 1983
to all radio amateurs bt

the solar flux curve continued downward, from 111 on november 9 to
82 on the 20th. the most recent 82 was recorded september 1, 1577,
only 14 months into the present solar cycle. this does not
indicate that we are 14 months from the end of cycle 21. solar
activity rises rapidly in the early years of the cycle, but the
decline afternthe peak is much more gradual. loss of dx on 28 mhz
this fall has resulted from high geomagnetic activity rather than
from the considerably lower solar flux values in recent weeks.

propagation was no better than fair from november 8 through 20.
things shokld improve early in the forecast week, holding up from
at least the 24th. the solar flux will be rising again by then,
but geomagnetic activity will be high intermittently from the 26th
to the rest of the month. the next really good conditions after
this thursday should begin about december 2.

american sunspot numbers for november 10 through 16 were between 25
and 62 with a mean of 39 ar

The STS-9 Columbia cabin to ground communications is being re-transmitted by
the Goddard Amateur Radio club on the following frequencies:

     3860 kHz 14295 kHz
     7185 kHz 21390 kHz
               28615 kHz

and in the Washington, DC area, on 147.45 MHz FM. Only 3 of the HF
frequencies will be used at any given time. In addition, cabin video and
audio will be re-tranmitted, in color fast-scan video on the Metrovision
ATV repeater in Alexandria, VA. The output frequence of the ATV repeater
is 426.25 MHz.

Take a listen; its refreashing not having to listen to television network
commentators babble about goings on..

Somehow, Bernie's computer got into a foul mood earlier today
when he tried to download the info on the W5LFL schedule. After
a half-hour's work with my word processor, the following should
represent a fairly accurate transcription of what he tried to
post. Since the original was so badly garbled, I am taking the
liberty of purging it from the AMSAT BB.

Bernie: pse qsl that nothing got lost.

Subj: STS-9 Elements
Is the latest estimate for STS-9 elements posted anywhere? If not could someone give them to me. I was going to wait until the mission was actually in progress to post any elements to my BBS by my phone has been ringing off the wall with requests. Thanks.

AMSAT shares in all the Amateur Radio community's loss in mourning the untimely passing of ARRL President Victor C. Clark, W4KFC. Vic passed on on Friday evening, 25 Nov 83. Our loss is personal and deeply felt.

Subj: W4KFC Remembered

Today was a day of personal sadness for me. I was informed of the passing last night of a friend, a Life Member of AMSAT, an inspiration to our hobby. Vic Clark, W4KFC, the President of the ARRL, passed away following a heart attack at his home in Virginia.

It was only two weeks earlier that many of us had seen Vic at the AMSAT annual meeting. He had the usual twinkle in his eye as we exchanged our old, oft stated personal joke about my being his older brother. His brief comments at the meeting again showed that he viewed AMSAT as a major contributor to the future of amateur radio. Vic's membership in AMSAT stems from the first inception of the organization and he was always there when we needed help. On losing Phase-3A, Vic was among the first to call in offering support by saying "that's OK, WE will do it again".

It is a great pity that Vic did not live to see one of his pet projects come to fruition -- the W5LFL flight scheduled to start on Monday. Vic was very much involved in all the planning for this mission. Vic and I (with W3XO doing much of the ghost writing) co-authored the joint ARRL/AMSAT proposal to NASA that resulted in this exciting adventure we are all waiting for.

On hearing of his passing, my retrospective thoughts went back to a time over a quarter of a century ago, when, as a student, I met Vic for the first time. I remember marveling at his abilities as an operator and contester; his exploits made him one of my true heros. Years later, our paths crossed again thru AMSAT. But after a decade and a half, he still remembered me and my shaky fist, and we joked about young "wet behind the ears" W0IUF and the QSO's we had. I imagine many others have been similarly inspired by his fine operating skills and his willingness to work with newcomers.

Vic, we'll miss you. I won't be surprised someday, out of a pileup, to hear a very distant voice saying "Kentucky Fried Chicken". Until then, 73.

W3IWI

hr arrl bulletin nr 116 from arrl headquarters
newington ct november 26, 1983
to all radio amateurs bt

radio amateurs throughout the world mourn the sudden passing, on
november 25, of our beloved arrl president, victor c. clark, w4kfc,
after a massive heart attack. vic had served as arrl president
since 1982, and had brought to the post the personal qualities
which made him one of the most respected and best known members of
the worldwide amateur radio fraternity. vic clarks passing brings
a great personal loss for those who knew him and leaves a void in
the arrl organization which he had served for five decades in a
variety of volunteer roles. a memorial service is scheduled for 2
pm. wednesday, november 30, at the christ church of washington,
3855 massachusetts ave, washington, dc. the family requests that
no flowers be sent, but that memorial contributions in lieu of
flowers be made to the arrl foundation, the purpose of the memorial
fund to be designated later. arrl first vice president, carl l.
smith, w0bwj, assumes the office of president for the remainder of
the term. to repeat, arrl president, victor c. clark, w4kfc, died
suddenly on november 25 ar

qst de ad7i
hr propagation forecast bulletin nr 48 from arrl headquarters
newington ct november 28, 1983
to all radio amateurs bt

the solar flux dropped to 80 on november 23, its lowest since early
august 1977. it has risen gradually since, reaching 87 on the 27th.
higher flux levels are likely through the first week of december.

when solar activity is low, the best available sho t term indicator of propagation conditions is the geomagnetic index given hourly by wwv and updated every three hours. if the k value is two or lower, and decreasing, good high latitude propagation will prevail. rising k values mean increased fading, lower muf, and loss of propagation on high latitude circuits.

poor conditions prevailed as this bulletin was being prepared, but improved propagation and higher muf are expected december 1 through 4. about a week of less favorable propagation is due after the 5th.

the f layer muf is closely related to the solar flux. values in the 80s or lower mean marginal propagation onn 21 and 28 mhz, and long skip on all dx fr quencies. dx horizons expand markedly on 80 and 160 meters when the flux is below 100 and falling. the number and duration of openings on 21 and 28 mhz are decreasing currently, but occasional high signal levels and very long skip will keep these bands interesting for another year, at least ar

According to my calculations, Hams in the Midwest can work W5LFL at the following times:

DATE	FROM (CST)	TO	ORBIT
WED 30	11:10 AM	11:25 AM	34A
FRI 02	6:35 PM	6:55 PM	71D
SUN 04	8:55 AM	9:23 AM	97A
MON 05	8:42 AM	9:05 AM	113A
TUE 06	8:29 AM	8:50 AM	129A
TUE 06	4:18 PM	4:48 PM	134D

W5LFL will transmit on even minutes, listen on odd minutes.

W5LFL will transmit on 145.55 (145.53, and 145.57 backup).

W5LFL will listen on 144.91/93/95/97/ 145.01/03/05/07/09.
     (one of the above at a time)

Give his call once at the beginning of an odd minute and repeat
your call several times.

Bob, K9EUI

For those of you who need the exact time and are willing to pay for it - you
can get it from the US Naval Observatory by calling 900-410-TIME. The price
is 50 cents for the first minute and 35 cents for each additional minute.
I believe WWV now has a 900 number (although I don't know what it is) and
the rate would be the same.

Has anyone out there experienced any audio problems with Kenwood
HF transcievers? A specific case I ran into recently was with
a 830 that a friend of mine has. The problem is RF getting into
the processor via the mic cord. The rig performs well with the
processor off but only when connected to a dummy load, will it
work with the processor on. His shack is about 40 feet immediately
below the 15 meter beam. We solved the problem by adding a .01 cap
between the mic lead and chassis ground (not the mic shield).

The problem occured with both the MC-50 desk mic as well as the
Kenwood mobile mic.

I also wonder why, if the mic shield and chassis ground are supposed
to be "separate", they put a cap between those 2 grounds (I forget
the pinout). This is the only problem like this I have ever hear of
with a piece of Kenwood gear. I could perhaps understand it if he were
using a long wire or something with lotsa RF in the shack and getting
RF burns off the equipment......

Talked to the ARRL after this noons flyby, and I am told that the antenna
is not oriented to favor ground communications, nor will it be for a few
more days. Not sure quite what this means, but they felt that signals heard
would be weak copy. At any rate, about 4 or 5 carloads of hams here
listened, and a few of us thought we heard something, although VERY
weak. could be some local pranksters, however.

Anyone have any further information....ANYONE HEAR W5LFL???

If anyone has the ascending node EQX times (UTC) and longitude for the
US orbits of STS-9, specifically the Western US, posting to this
net would be appreciated.

Also, I need to confirm the following orbital parameters:

Nodal period: 89.40 minutes
Long. Increment: 22.71 degrees/orbit
Average Height: 249.5 Km
Inclination: 57.0248 degrees

The above info was for the previous launch date.

Any updates would be appreciated.

Thank you,

WB7FFV

2nd revision of Midwest W5LFL sked times:

DATE	FROM (CST)	TO	ORBIT
WED 30	11:10 AM	11:25 AM	34A
WED 30	7:00 PM	7:25 PM	39D
THU 01	9:27 AM	9:47 AM	49A*
FRI 02	5:05 PM	5:30 PM	70D*
FRI 02	6:35 PM	6:55 PM	71D
SUN 04	8:55 AM	9:23 AM	97A
MON 05	8:42 AM	9:05 AM	113A
TUE 06	8:29 AM	8:50 AM	129A
TUE 06	4:18 PM	4:48 PM	134D

* added orbits not originally listed for Midwest but
should be usable.

Orbit 49A Texas - Maine
Orbit 70D N. Dakota - N. Carolina
97A Texas - Indiana
113A Texas - Mich.
129A Texas - Ill.

W5LFL will transmit on even minutes, listen on odd minutes.

W5LFL will transmit on 145.55 (145.53, and 145.57 backup).

W5LFL will listen on 144.91/93/95/97/ 145.01/03/05/07/09.
     (one of the above at a time)

Give his call once at the beginning of an odd minute and repeat
your call several times.

listen to one of the HF ham stations for orbit time updates.
WA3NAN at Goddard has been on 3860, 7185, and 14296 kHz.

Shuttle communications have also been monitored on 20.198 kHz.

x
       At the Indian Hill (BTL) Amateur Radio Club, some of
      us
       tried listening on 2 meters for W5LFL during the 11:10 -
       11:25 AM pass this morning (November 30).

       Neither we, nor anyone else here in northern Illinois seemed
       to hear W5LFL. The biggest problem was the hoards of sta-
       tions transmitting on the downlink frequency. Many didn't
       know the correct procedure, others just acted as "kilocycle
       cops," compounding the QRM.

       If W5LFL was in there, he was deep underneath a
      pileup of
       others trying to call him!

Subj: STS-9 Elements
Rip, I note the drag factor is an order of magnitude different
in this STS-9 element set. Any rationale for that?

Also, the set is for epoch on orbit 48. Bernie's message
shows earlier orbits usable in the western US. Is there
any chance of getting an earlier epoch?

Subj: STS-9 Sked
Bernie, thanks for the operating sked for STS-9. I and many
others locally appreciate it. We are all planning some
mountaintopping.
The earlier schedule showed only one pass on which Owen
would be available from the western US. If this sked
is the actual ham operating sked, there are now 9 orbits
we can work. That seems like a tremendous increase in
available time. Am I misinterpreting the data?

Subj: computing backwards
Rip, Could you please mention something like the following on the nets:

There have been a few comments that the preliminary element set given
by W5RRR was a couple of days into the mission and thus later than some
of the published orbits for communication with W5LFL. Users of any
version of the W3IWI program are reminded that computations can be made
for a days prior to the reference epoch by so specifying the date for
beginning of the prediction period.

(I have taken the beginning element set and computed backwards to the
launch date and time. All of the AOS/LOS times for my location, 27.48N
and 97.24W, are in close agreement with figures for CENTRAL U.S. orbits
that were previously published. Of course my times are toward the
beginning of the window for ascending passes and toward the end of the
window for descending passes.)

(There are a lot of folks out there who just decided to learn how to
use their programs yesterday.)

Subj: STS-9 Launch
The launch of STS-9 was witnessed at the Press Site yesterday by KB2M and
myself.

I must admit that it was one of the most impressive things I've ever
seen; after I've collected my thoughts I will attempt to write a more
lucid description of what it looked like. It's very difficult to do so
because it is so far outside the realm of everyday experience...

Subj: STS-9 drag
In reference to the high drag factor on STS-9, yes, this is quite

believable. The extremely low altitude, combined with the large cross-sectional area of the orbiter in certain attitudes (like belly first) causes this. There are a number of OMS burns scheduled during the mission to compensate for orbital decay.

Unless we can get very frequent Keplerian elements, I think that tracking this thing with a gain antenna is going to be an exercise in luck.

The next meeting of the Pacific Packet Radio Society will be held on:

Tuesday, December 6th, 8:00 pm

AMPEX Cafeteria
401 Broadway
Redwood City, California

On Route 84 at 101 or 280, proceed south on Broadway in Redwood City about 2 to 3 blocks. The cafeteria is glass enclosed and is adjacent to a small fountain area. It will be on your right as you travel south.

The new TAPR kits have arrived, and the Tucson crew has outdone itself again! Packed in a magnificent shipping carton, and accompanied by a manual in a gold-embossed brown vinyl binder (and weighing as much as a phone book), the first few "gamma" boards have arrived in Northern California. If you think I'm kidding, come to the meeting to see Packet Radio's latest creation.

Our featured speaker will be Mike Spaan, WB6KTN, formerly of the Chico packet repeater, who will talk about contention. Mike will review the problems, strategy and theory behind contention protocols. He'll discuss the currently used contention algorithm in the VADCG sw, and will discuss some problems noticed when our channel gets busy.

Also, I'll give a report on the AMSAT General Meeting, and a summary of the ARRL Digital Communications Committee meeting held recently (we've allocated the lower 100kHz of 20 meters to be exclusively RTTY, AMTOR, MSO's and PACKET).

We also hope to have a short report on Cal Teague's experiments with Miller encoding (for high speed packet) and on two new host systems put on the air by WB2GDQ and WB6KTN.

And, of course, any other news that might come up.

See you at the meeting --- 73, Hank

P. S. Mark your calendar for these future meetings of PPRS:

January 10th, February 7th

The same phenomenon is happening in the New York area (QRM on
145.55mhz). It has bordered on becoming a real zoo. Unfortunately this
is precisely what many people were afraid of; there are probably more
scanners among the general public out there listening than have ever
been tuned to the 2 meter band, and look at the impression that is being
made. There were just as many people saying "Keep the frequency clear,
you $%#@@$#@!!" as were calling W5LFL on 145.55 mhz, even though
the shuttle was over Australia!! On the other hand, judging by how
quickly the channels from 144.91 to 145.09 filled up precisely on the
odd minutes with calls during the actual passes, I believe that the turkeys
were in the minority; there were many more people who did know proper
procedure.

I also found when I broke in (during times that I knew STS-9 to be
below the horizon, of course) and announced the exact rise and set
times, along with the fact that Owen will not listen to his downlink
frequency, and was probably not even on at the time, people appreciated
the information and the garbage seemed to subside quite a bit. Once
everybody knew when the actual rise and set times were, there was
very little QRM on 145.55 during actual passes.

If you have patience, access to up-to-date orbital information and an
authoratative-sounding voice, you may be able to do the same
in your local area.

Phil

Subj: More W5LFL #40

W5LFL apparently began operations from Columbia on orbit 40 this
evening. There are sketchy reports of hearing W5LFL on orbit 35
but these are as yet unconfirmed. According to ARRL, Columbia was
due to be flying in an unfavorable attitude on orbits 34 through
39 with the antenna pointed to the sky instead of earthward.

I have just listened to an audio recording of W5LFL's pass over
the northwest on orbit 40 made by KA7APJ, Jim Smith, Area Coordinator
for Washington, QTH, Seattle. Garriott's signal was truly outstanding.
A DFQ signal with no interference whatsoever. He was calling
CQ North America from W5LFL on the space ship Columbia. It was
really him too. I recognized his voice with certainty.

KA7APJ was not able to establish contact, however. He had a live
TV crew on-scene for the excitement. I think it's fair to say that
the media (broadcast and print) have glommed onto this event even
more strongly than we had hoped (feared?)!

Tomorrow the ultimate test. W5LFL over Washington, Baltimore, New York,
Boston, Philadelphia, Hartford, simultaneously.

Can you imagine the QRM?!?

I just listened to the ARRL Shuttle Hotline (203-666-0688) and was told
that W5LFL worked the west coast on orbit 35A, although his antenna is
NOT favorable in direction for ground communications. The schedule,
as of 5 pm yesterday (EST WED), is as follows

WED: 40D
THUR: 49A
      56D
FRI   70D
      71D
      72D

These are orbit numbers, so he is evidently still following the original
schedule, but no mention was made of operation on orbit 34A, so I guess
us midwesterners who thought we may have heard him faintly, were fooled
by the local qrm.

Good Luck, Steve Wheatley KU9C inuxc!wheatley

The operating during orbit 39D was a fiasco! There were more stations
calling on .53, .55, and .57 than there were on the proper freqs.
Also, I never realized how many hams can't tell time! I was most
surprised to hear W9JUV calling on even minutes.....

Late word from ARRL has it that two more passes will be added to W5LFL's
operation: orbits 96A and 112A.

I have tried the program from March 81 Ham Radio, and it works fine.
The only problem is the required element entry format is different than
that normally supplied for OSCAR10. The program requires 'time reference
at apogee' and 'longitude at apogee', rather than RAAN and Epoch.

Does anybody have a modified version of the program, for the normal
data points, or any suggestions.

Paul kw7y

Lines: 24

The "Low Band Skip" column in the October 1983 issue of the Radio Communications Monitoring Association (RCMA) Newsletter mentions 3 Central American repeaters which use the following frequencies during daylight business hours:

o+ 33.475 MHz

o+ 33.675

o+ 33.875

All transmissions are in Spanish. The 33.675 frequency is apparently a timber logging operation in Nicaragua.

With a poor antenna at 15 feet, I can hear the activity on 33.675 and 33.875, but haven't detected anything on 33.475. Can anyone else hear these stations?

I can supply orbital information to the net in several forms if people
are interested (in fact, the info that W1AW has been broadcasting
came from me.)

I can post keplerian elements for the tracking programs and/or
apogee times and positions.

From: Hank Magnuski, KA6M
Date: October 21st, 1983

Subject: PPRS November Meeting

The next meeting of the Pacific Packet Radio Society will be held on:

Tuesday, November 1st, 8:00 pm

AMPEX Cafeteria
401 Broadway
Redwood City, California

On Route 84 at 101 or 280, proceed south on Broadway in Redwood City about 2 to 3 blocks. The cafeteria is glass enclosed and is adjacent to a small fountain area. It will be on your right as you travel south.

Our November meeting will be a discussion and tutorial on MODEMS, specifically, those types which could be used for packet radio service. We will discuss some of the constraints and requirements for a good radio modem, and review some of the modems currently in use. In particular, we will take a close look at the TAPR modem, as the circuitry used there has appeared in a number of other designs.

In addition, other current topics and the latest news will be discussed.

See you at the meeting --- 73, Hank

P. S. Mark your calendar for these future meetings of PPRS:

December 6th, 8 pm, AMPEX Cafeteria

qst de ad7i
hr propagation forecast bulletin nr 43 from arrl headquarters
newington ct october 24, 1983
to all ra io amateurs bt

the two sunspot groups mentioned in last weeks bulletin have gone
around the west limb. their activity was fallin off, and there have
been no new significant areas to replace them. after a high of 140
on october 18, the solar flux fell quickly to 88 on the 22. this was
the lowest flux value reading in nearly 6 years.

despite marked lower solar activity, propagation was generally good
on 28 mhz last week, especially october 19 through 21. this was
mainly because the sun was entering its most favorable position of
the year for hf propagation in the northern hemisphere.

there were traces of new east west activity october 23. the solar
flux rose only one point, but the trend should be toward higher
readings through early november. if there are no major flares, and
the flux rise is gradual, some of the best dx conditions of the
autumn will be enjoyed november 4 to 9. disturbances for low levels
and severe fading in the past two days should clear by october 5 and
propagation should peak october 27 to 29. disturbances and high
latitude propagation are likely again october 30 through november 3
before the longer period of generally good conditions begins about
november 4.

american sunspot numbers for october 13 through 19 were between 39
and 85 for a mean of 58.9 ar

Members of the AT&T Bell Laboratories Indian Hill Amateur
Radio Club (WA9WSL), here in Naperville, IL, have been
monitoring the emergency radio traffic from KA2ORK/J2
in
Grenada. We have been listening on 14.351 MHz USB.

Apparently, the FCC has given a few designated amateurs
special permission to participate in this directed net,
outside the 20 meter amateur band.

Has everyone received the contest info for the CQ-WE contest
coming up this November 12 & 13???? If not, or if your not
sure what the contest is, send me a note or call and I cann
fill you in on the details and let you know where to get further
information. Its a fun contest, and open to all Bell System
amateur radio operators.

See you on the air that weekend!!

hr arrl bulletin nr 105 from arrl headquarters
newington ct october 28, 1983
to all radio amateurs bt

in a news release dated october 28, the fcc has high praise for radio
amateurs and the role they played in the recent grenada situation.
the commission waived some of its rules to facilitate communication
by mark barettella, ka2ork, and other assisting operators. in the
commissions words, quote, at all times the paramount interest of this
agency was the safety and welfare of the medical students on the
grenada campuses. mr. barettella and the amateur operators assisting
him provided valuable services in relaying information as to the
safety of the medical students and their families and as to the
general situation existing at the grenada station, unquote ar

hr dx bulletin nr 42 from arrl headquarters
newington ct october 27, 1983
to all radio amateurs bt

thanks to w1trc and k1mm of the southern new england dx association
for the following dx information.

palmyra. look for ad1s/kh5 starting november 5 for the next five to
six days. time permitting, ad1s also plans a trip to t32, kiribati.

ivory coast. tu2nw, tom, has determined that 160 meter operation is
allowed for the ivory coast. plans are to put up a 160 meter
antenna within the next month. a license has been applied for
operation from j5 and plans are to make a trip between now and
february. more information to follow as plans develop. a license
was received for operation as 5t5nw, mauritania, and he is trying to
obtain a license to operate from tz.

lloyd and iris colvin, w6ql/hk3, plan to leave columbia november 1
for a one month stay in ecuador. following this they plan to travel
to peru about december 1. after that they will travel to chile and
plan to operate from ce0.

china. look for by4aa to be active again november 1 through 3 with
possible ssb operation. by8aa has been worked recently on 14016 khz
at 0200z.

belize. a group plans to use the call v30aa for the cq ww dx
contest. american operators using the calls v3ep, v3sl, v3es, v3cq,
v3dx and v3ee plan to be active through thursday, november 3. qsl
to n6adi.

nigeria. kc7uu/5n23 will use 5n23pdc during the cq ww dx context.
chuck is also active on 160 meters mondays and tuesdays. a trip is
planned to 5u7 december 9.

central african republic. tl8ck has been active on 21290 khz at
around 2200z. qsls to f6ewm.

kermadec island. rumor is that a ham on the latest scientific
expedition may become active after the first of the year.

mauritius. 3b8db has been active on 14220 khz at around 0215z.
qsls for taher go to k5bdx.

rwanda. 9x5mk has been active on 10 meters on 28540 khz at around
1900z. also has been heard around 21280 at 1930z.

hong kong. vs6do has been worked on 7002 khz at around 2315z.

rodrigues island. 3b9fk has been active on 80 cw at 0100z.

antarctica. four amateur radio operators are needed to help with
communications on a mountain expedition in antarctica. no climbing.
base station will be on king george island at the south shetland
islands. the expedition will leave november 28. for further
information, contact dave porter, k2bpp.

to all radio amateurs bt

the fcc released on october 26 the following pu lic notice regarding
rebroadcasts of amateur radio transmissions.

radio and television stations need not obtain prior authorization
from the federal communications commission before transmitting
amateur, ham, radio transmissions. broadcasters are free to air the
amateur radio transmissions which they have monitored. they may
broadcast such amateur radio transmissions on a live or delayed
basis, with or without the approval of the amateur operators
involved. broadcasters are cautioned, however, that in covering
amateur radio activity, they must not become actively involved in
the amateur transmissions. that is to say, the broadcaster may not
employ an amateur station as it would use a reporter or a translator
in order to convey, directly or indirectly, questions or subject
matter which the broadcast station desires to be addressed.

broadcast stations are asked to advise the secretary, federal
communications commission of the fact that retransmissions of
amateur radio transmissions have occurred, indicating only the date
and nature of the transmission which was covered.

qst de ad7i
hr arrl bulletin nr 102 from arrl headquarters
newington, ct october 26, 1983
to all radio amateurs bt

the fcc has declared the urgency of the communications emergency
with the island of grenada, west indies, has subsided. therefore,
effective immediately, the fcc has cancelled, repeat cancelled,
emergency temporary third party traffic authorization for amateur
communications between gredada and the united states. fcc stated
further there are no longer any frequencies, either amateur or non
amateur, set aside for emergency communications by amateurs with
grenada. also, any previously authorized use of amateur cw subbands
for telephone use between the u.s. and grenada is now cancelled ar

I spoke with John Botowski of the FCC Personal Radio Bureau today re
the status of the no-code license. He says that the comment period and
the comment reply period have ended, there are about 5000 comments in
16 volumes, and the commission will probably decide the matter toward
the end of this year or the start of '84.

I asked specifically about the CIA rumor; his response was that in
looking thru the comments he had not noticed any from the CIA. These
comments are available for public inspection if you're in DC, and there
is a commercial copy service which will copy them for you if not.
However, John warns that they will probably charge by the hour for
search time thru 16 volumes to find what you want and thus it could get
expensive. (The comments are not ordered in any particular fashion.)
The copy service is International Transcription Service, info at
202-296-7322, if anybody is interested.

I am considering the purchase of a Sony ICF-2002. It is a synthesized
PLL receiver. Like the ICF-2001 it has no tuning knobs, only a keyboard
for frequency entry and "up" and "down" scanning buttons. My intended
usage is for casual listening. The major difference between the 2001
and the 2002 is that the 2002 is tiny - about 1/3 the size of the 2001.

Has anybody have experience using this receiver, or its predecessor
the 2001?   Whats it like not having a tuning knob?

I haven't heard of the Sony ICF-2002. Where can
I see and play with one and how much are they.
I have always liked to the 2001 but thought it
too large. The 2002 sounds very useful for
the traveling SWL or ham.

The following is from the 1 Nov 1983 issue of the New Scientist, page 73. Note that this new satellite is *not* PACSAT; it is UoSAT-B, and will be called UoSAT-Oscar-11 if all goes well and it reaches orbit. The "mailbox in the sky" which is referred to here is actually just an engineering test experiment (various memories, etc.) The PACSAT people are flying it on UoSAT-B only because the Surrey people decided to take advantage of the last remaining polar Delta launch opportunity. The real PACSAT will still fly on the Shuttle in 1986.

Phil Karn, KA9Q

"Britain's mailbox heads for the skies"

"A British-built satellite that will act as a "mailbox in the sky" for radio amateurs should go into orbit early next year. The vehicle, the second in a series of cut-price satellites built at the University of Surrey, will contain an electronic memory that receives messages from the personal computers of radio enthusiasts. The memory will store the messages, transmitting them to receiving equipment only when the satellite is in the right position above the Earth.

"For a team of 20 engineers at the university, building the space vehicle will be a race against time. NASA in the US has told the group that its satellite can hitch a free lift into space on board a rocket due to leave the ground in March. The rocket's main mission will be to take into orbit a remote sensing satellite to replace the ailing Landsat 4. But the Surrey team will have to squeeze into six months work that would normally take up to three times as long.

"The university's first spacecraft, UOSAT-1, [actually, UoSAT-Oscar-9 -PK] is still circling the globe two years after it was launched. It gathers information about radiation levels and the Earth's magnetic field. The satellite also has a speech synthesiser with which it relays spoken messages to receiving station. Martin Sweeting, the leader of the university team, regularly tunes into the messages with a cheap radio in his back garden. He has even "listened in" while on holiday in the Himalayas.

"A second part of the project is to find cheaper ways of building satellites. The first Surrey vehicle cost &250 000. A comparable craft built by industry would cost some 40 times as much."

****

POOR PLANNING !!! (the following was taken from the MOBILE FLUTTER, May 83)

From western Carolina ARS to Birmingham ARC to Mobile ARC, an article entitled "ANTENNA RAISING ACCIDENT" (author unknown) is called to our

attention by WD40KY:

One HAM's letter to his insurance company:

I am writing in response to your request for additional information for block number three of the accident reporting form. I put "poor planning" as the cause of my accident. Your said in your letter that I should explain more fullly and I trust that the following detail will be sufficient.

I am an amateur operator and on the day of the accident, I was working alone on the top section of my new 80 foot tower. When I completed my work, I discovered that I had, over the course of several trips up the tower, brought up about 300 pounds of tools and spare hardware.

Rather than carry the now unneeded tools and material down by hand, I decided to lower the items in a small barrel by using a pully, which fortunely was attatched to the gin pole at the top of the tower. Securing a rope at ground level, I went to thr top of the tower and loaded the tools and material into the barrel. Then I went back to the ground and untied the rope, holding it tightly to insure a slow decent of the 300 pounds of tools. You will notice in block number eleven of the accident insurance reporting form, that I weigh only 155 pounds. Due to my surprise of being jerked off the ground so suddenly, I lost my presence of mind and forgot to let go of the rope.

Needless to say, I proceeded at a rather rapid rate of speed up the side of the tower. In the vacinity of the 40 foot level I met the barrel coming down. This explains my fractured skull and broken collar bone, Slowed up slightly, I continued my rapid ascent, not stopping until the digits of my right hand were two knuckles deep into the pulley. Fortunately, by this time, I had regained my presence of mind and was able to hold onto the rope in spite of my pain.

At approximately the same time, however, the barrel of tools hit the ground and the bottom fell out of the barrel. Devoid of the weight of the tools, the barrel now weighed approximately 20 pounds. I refer you again to my weight in block number eleven.

As you might imagine, I began a rapid descent down the side of the tower. In the vicinity of the 40 foot level, I met the barrel coming up. This accounts for the two fractured ankles and the lacerations of my legs and lower body. The encounter with the barrel slowed me enough to lessen my injuries so that when I fell into the pile of tools, fortunately only three vertabrae were cracked.

I am sorry to report, however, that as I lay there on the tools, in pain, unable to stand and watching the empty barrel 80 feet above me ... I again lost my presence of mind.

I let go of the rope.

****

For all you people with SUPER POWER rigs, here's how to turn everything
on and off without putting yourself into mortal jeopardy.

3 phase 30/40 ampere 600 volt AC contactors (use on 240 or 480 VAC 3 phase
line). Brand new. 120 v coil actuator. Rated to drive 3 phase, 3 pole 480
volt AC motors. Made by ELMWOOD SENSORS. Is it worth $10 to save your life?

It now seems to get Denver directory assistance!!

The operator told me tha they've been getting calls
intended for WWV all day. Looks like the service
is popular.

========== N O T I C E ==========

Several people have commented on the bulletins. Thanks to
all for the nice words. Bulletins are sent pretty much
as received. Fills are made where obvious, but I don't check

each transmission with a fine tooth comb.

The bulletins a placed on the net using all lower case rather
than upper case because lower case is easier to read. If someone
would be so kind as to provide me with a filter that will
convert the first letter in each sentence and all prosigns
to caps I would be happy to pass all data through it before posting
to the net. However, I am not willing to take to time to go
through it by hand. Finally, sending the bulletins using all
uppercase is out of the question.

I called 800 directory assistance. They told me that the National Bureau
of Standards had an *unlisted* 800 number. They would not confirm that
the 800-957-9999 was it, or had been it. They would also not comment on
why when I dialed the above I got Boulder directory assistance.

It seems that WWV's 800 number has ceased to function here in 201-land.
When I last tried it about a week ago, it was fine. Now, I get the
"your call cannot be completed as dialed" message. Have they changed
the number?

b
Back in the distant past (about as far back as my memory goes), somebody
used to post a net.ham-radio callbook monthly or so. I was never sure if
this was a list of people who had contributed since the last posting of
the list or a list of people known to be affiliated (actively) with the
newsgroup. Whatever happened to this practice? I rather liked it.

I just received my card from Niue Island (ZK9RW), and he has
enclosed a note saying that he has IRC's for sale...$40 per
100, with proceeds helping future dxpeditions. He also
notes that his next dxpedition, ZL/K, is go for Feb/Mar 1984.

If you need the qsl for ZK9RW, or IRC's, write Ron
at

Ron Wright ZL1AMO
28 Chorley Ave
Massey AUCKLAND 8
NEW ZEALAND

P.S. I think a US check may be good to him, as his qsl cards come from
washington with a 20 cent us stamp when returned...obviously he has a friend
stateside. If in question, may help to drop him a line first.

When net.ham-radio was first created back in 1981, I posted a
"call book" of net.ham-radio readers/contributers with name, call, and
electronic mail address.
At first, this was weekly; later monthly.
I stopped doing it in Dec. 1982 for two reasons:
1) It was unclear if anyone found it useful; and
2) there was no easy way to know when to delete entries (if someone left
the net.)

I still have the last callbook (Dec 82) and could repost it and go from there.
but it probably needs a lot of revision.

What say? How many are interested?

    handheld 2m rig for sale

COMPLETE Mint TR 2500 2 meter hand held system for sale.
The unit comes complete with speaker-mic, one alkaline
and two nicad battery packs, leather carrying case,
charger and antenna. See Nov QST page 134 for a complete
description. Price is $300 complete, shipping included
to the lower 48 states.

The following is the new CW bulletin on the Amsat-Oscar-10 general beacon:
"Mode B is on hingain [sic] antennas and signals are normal
Do not use more than 500 W EIRP transponder AGC is 20 DB down so pse
QRP Mode L experiments will start in Septembre [sic] AMSAT OSCAR 10 HI HI"

With virtually no effort at all in the past few days (I've been content
to mostly listen) I've worked Ecuador, Netherlands, Germany, Finland,
France and England, not to mention plenty of US. Not bad for VHF/UHF!
I've heard many of the "famous" moonbounce stations on the satellite
(VE7BBG, K2UYH, PA0SSB, etc) and all seem to be complaining that they're
having a hard time cutting their transmitter powers so as to avoid
overdriving the satellite. With 1-5 watts to their 70cm EME arrays they're
still the strongest signals in the passband! If we can get everybody
down to more reasonable EIRP levels then everybody will benefit from not
having to run so much power.

The high gain antennas are still offpointed somewhat. They're in the
orbit plane, but rotated about 15 degrees toward the east. This results
in steady signals before and at apogee, followed by very noticeable spin
fading after apogee. The antennas will probably be correctly pointed by

the end of this coming week.

qst de ad7i
holmdel, new jersey, u.s.a.

hr propagation forecast bulletin nr 33   from arrl headquarters
newington ct august 15, 1983
to all radio amateurs bt

after rising to 155 on august 12, the solar flux fell back again to
139 by the 14th. despite this drop the flux is running well above
its levels for the same points in the previous solar rotation.
     such
statistics emphasize an important point regarding the so called 11
year cycle. we still have periods of relatively good solar activity,
despite the statistical peak of cycle 21 having occurred nearly four
years ago. there were 189 days during the peak years, 1979 through
1981, when the flux was 155 or lower. twice in those years it
remained below 155 for a week or more at a stretch.

during the forecast week, the flux should go lower for another day or
two, then start back up again about the 18th. there was a mild
disturbed period just before bulletin time, but things are improving
and august 16 to 18 should bring good summer conditions. a recurrent
disturbance is expected about august 19 to 21. look for generally
good propagation and the first significant rise in muf of the fall
season beginning about august 31 and lasting through the first days
of september. vhf enthusiasts in the higher latitudes may have
auroral propagation around august 20 and 29.

american sunspot numbers for august 4 through 10 were between 58 and
90 with a mean of 69.9 ar

Below is a repeat of a previous message. Some folks on the net have wondered what the ZAMTOR hex code was that was posted earlier on the net. Well, here is a description.

All ZAMTOR users should be aware that rel 1.00 and 1.01 have serious bugs and should not be used. rel 1.02 and 1.03 both work fine (1.03 has some additional features over 1.02)
73, Paul, ad7i

Preliminary documentation and firmware are available for a stand-alone Z80 AMTOR system. The "Z-AMTOR" system operates with a home-brew (PC ready about 83.10.15) 4 MHz Z80 system and works with Baudot terminals at 45, 50, and 74 bps as well as ASCII terminals at 110 and 300 bps. This system runs modes A, B, S (selective B) and L (monitor mode A communicaitons). It is, if I say so myself, one of the best implementations of AMTOR available. It has been in the programming stage for over a year.

Anyone SERIOUSLY interested in building such a system is invited to send a $0.71, 9" x 12" SASE and a 250 nS 2764 EPROM to:

Paul Newland, ad7i
POB 205
Holmdel, NJ 07733

I will forward a copy of the documentation and program your EPROM.
Be sure the stamps are glued onto the envelope. Don't send
money, I'll just pocket it and claim I never got your letter!
NOTE: don't send an SASE without an EPROM. If you do, I'll return
your envelope without stuffing it. If you don't send an EPROM you
probably are not serious about building a system. I am looking for
people to help me test the code, not increase my xeroxing costs!

If you are not totally passionate about AMTOR but would like to get
the documentation, way till later this year; it will appear in one
of the major ham mags.

73, ad7i

b
I stayed up all last night (aug 17-18) listening to the hurricane net
on 20 meters (14.325 usb). It was fascinating. I heard of other
frequencies carrying info on the hurricane (40 and 75 mtrs) but could
not pull in anything on any of them. At any rate the two apparent
net controllers K1WW (east) and esp. N7YL (west) were doing great
stuff.

The question is: I discovered this only by accident, listening to a
local 2-meter net (one of the participants mentioned it and i rushed
over and turned on the lf rig). Supposing that I hadn't heard this,
where else might I have found it out? Obviously the emergency was sort
of an immediate thing, and the net could not have been scheduled in
advance. Or perhaps there are allocated frequencies that everyone
(almost everyone..) knows about?

The new 1984 Radio Shack catalog is out.

Page 76 shows two new synthesized scanners:

o+ PRO-30: 16 channel handheld for $300. Uses 6 "AA" batteries and 4 silver oxide batteries for memory (scanner available September 30).

o+ PRO-2003: 60 channel base/mobile for $350. Ten channels are dedicated for FM broadcast frequencies.

Page 78 shows a new crystal controlled scanner:

o+ PRO-25: 8 channel portable for $150 which covers VHF-LO, VHF-HI, UHF, and Aircraft bands.

Page 79 shows a Sony 2001 clone digital general coverage receiver with keypad entry for $300.

If you're interested in one of these radios, but think the price is too high, you can wait a few months. This stuff

will probably be on sale some time in the future.

This morning between about 05:00 and 06:20, three stations took part in packet radio experiments via Amsat-Oscar-10: ZL1AOX in Auckland, New Zealand; W3IWI in Clarksville, MD; KA9Q in New Providence, NJ. Limited HDLC frames were successfully exchanged despite the use of non-optimal noncoherent FSK modems (namely the XR chips provided with the TAPR TNCs). A major problem was frequency errors between stations due to the doppler shift caused by the different relative velocities to the satellite. The signal-to-noise ratio was also marginal for this modulation technique.

It appears clear that simple FSK (F1) is certainly not very good for satellite use but that PSK modems now under development in AMSAT should work very well under the observed conditions. PSK modems will automatically track changes in carrier frequency due to doppler shift and work well with typical signal-to-noise ratios on Oscar-10.

The following is by Tom Clark, W3IWI, AMSAT president, describing some of the further fun and games on Amsat-Oscar-10 this evening. Anybody who would like to join us is welcome!

Phil

Tonite was a remarkable nite -- multiple two-way packet radio tests were done by W3IWI, NK6K, ZL1AOX along with KA9Q and WA2LQQ as spectators. We used 1200 baud (and tried 600 baud) FSK on AMICON (L1) channel arount 145.830-835 downlink. The following is edited do to show some of the traffic copied at W3IWI:

First, I set up my beacon to transmit the following message:

W3IWI>BEACON:W3IWI Packet Radio Test -- Anybody Copy?
The quick brown fox jumped over the lazy dog's back 0123456789

Then I repeatedly called CQ:

W3IWI>CQ:
W3IWI>CQ:cq de w3iwi
W3IWI>CQ:is anybody there??
W3IWI>CQ:hello packets de w3iwi
W3IWI>CQ:w3iwi packet radio test
W3IWI>CQ:via amsat oscar-10
W3IWI>CQ:
W3IWI>CQ:
W3IWI>CQ: (etcetera)

Nobody was around, so I worked myself, going up to the satellite, back to myself, up to the satellite again, and then back down:

cmd:c w3iwi via w3iwi
cmd:*** CONNECTED to W3IWI
*** CONNECTED to W3IWI
test
test

now is the time for all good men to come and have a party
now is the time for all good men to come and have a party
cmd:d
cmd:***disconnected

Then, after a long time of sending to myself with KA9Q spectating, ZL1AOX showed up (he used CAP's, I used lower case):

cmd:c zl1aox
cmd:*** CONNECTED to ZL1AOX
hi ian -- how copy
OK I HAVE A CONNECT MSG TOM
ONLY OCCASIONALLY
ok, well I seem to copy u fb
DID U RX MY ACK?
yep
hi harold (NK6K called in on freq)
OK
RGR TOM IT'S NOT AS WELL AS IT SHOULD DOWN HERE
cmd:d
c nk6k
cmd:*** CONNECTED to NK6K
hi harold
Hello tom
seems pretty gud copy
Loks great
welcome to the wonderful world of racket radio !!!
Yep. am surprised,
1200 baud too
mebee we should tryy 600
Hot stuff!
etcetera

Then we tried a real first: I connected with myself, thru AO-10 to NK6K, who digipeated my packets back to me:

C W3IWI VIA NK6K
cmd:*** CONNECTED to W3IWI
TALK ABT DUMB THING TO DO
TALK ABT DUMB THING TO DO
cmd:D
cmd:***disconnected
C NK6K
cmd:*** CONNECTED to NK6K
DID U SEE WHAT I DID??
Copied 100%!!

Then we tried more experiments as NK6K and ZL1AOX tried to run my computer remotely.

The only question remaining -- where are all the other packeteers -- the AO-10 AMICON channel is now officially christened and operating well. Who will be the next to join us?

Tom

According to Westlink, the frequencies which Dr. Owen Garriott, W5LFL,
will use on the historic STS-9 Shuttle mission have been announced.

Dr. Garriott will transmit, using mode F3, on 145.550 MHz.
He will monitor frequencies between 144.910 MHz and 145.090 MHz, in
20 kHz steps.

According to an article in the September issue of 73 Magazine, Dr. Garriott
will announce which call area(s) he will listen for. He will announce his
intentions for 60 seconds. For the next 60 seconds, he will monitor his
preprogrammed frequencies between 144.910 and 145.090. During the next
60 seconds, he will read back a list of the callsigns he has recognized.

It is recommended that earth stations limit their transmitter output
power to 10 watts.

Remember, that Dr. Garriott is in charge of the show and can easily bypass
any channel having excessive QRM caused by the high-power boys.

Use a good antenna; a 2M turnstile is recommended. Do not use a highly
directional antenna; the Shuttle will be moving way too fast to keep it
aimed properly.

Westlink's Hollywood number, (213)-465-5550, will be devoted entirely to
STS-9 information starting September 1. Be sure to listen to the W1AW
bulletins. Good luck!

73,
John Opalko KA9MNK

Subject: Re hayes modem and amateur radio : net.ham-radio

I use a hayes smartmodem and tried that feature when i first
read the manual. i heard some dits and some dahs. i guess that
you could use them to turn your CW unit on and off. So you could
program your micro to turn ascii codes into Morse code.
I have not used the modem this way since.
Too bad it does not work the other way around too (Morse to ASCII)!

4749 DIANE DRIVE
MINNETONKA MN 55343

BULLETIN NR 74 FROM ARRL HEADQUARTERS NEWINGTON CT
AUGUST 29 1983 TO ALL RADIO AMATEURS

ASTRONAUT OWEN GARRIOTT...W5LFL...WILL BE OPERATING AN AMATEUR RADIO STATION ABOARD THE STS9 SPACE SHUTTLE MISSION WHICH IS SCHEDULED TO LIFT OFF OCTOBER 28. THERE WILL BE NO AMATEUR RADIO OPERATION FROM STS8...WHICH IS LIFTING OFF THIS WEEK.

BULLETIN NR 75 FROM ARRL HEADQUARTERS NEWINGTON CT
AUGUST 30 1983 TO ALL RADIO AMATEURS

EFFECTIVE IMMEDIATELY...THE W1AW TELEPRINTER SCHEDULE WILL BE TRANSMITTED WITH 45.45 BAUDOT FIRST...110 BAUD ASCII SECOND AND 100 BAUD FEC AMTOR WHEN TIME PERMITS. 100 BAUD FEC AMTOR WILL USUALLY BE TRANSMITTED FOLLOWING THE FRIDAY UTC BAUDOT/ASCII DX BULLETIN.

BULLETIN NR 76 FROM ARRL HEADQUARTERS NEWINGTON CT
AUGUST 31 1983 TO ALL RADIO AMATEURS

THE SEPTEMBER 1ST TELECONFERENCE RADIO NETWORK...AT 830 EDT...FEATURING SENATOR BARRY GOLDWATER...K7UGA...WILL BE RETRANSMITTED TO OSCAR 10 BY JACK COLSON...W3OZ. AREAS WITHOUT TRN REPEATER COVERAGE MAY LISTEN TO THE NET ON THE SATELLITE DOWNLINK FREQUENCY...AROUND 145.957 MHZ.

PROPAGATION BULLETIN NR 35 FROM ARRL HEADQUARTERS NEWINGTON CT
AUGUST 29 1983 TO ALL RADIO AMATEURS

IN LATE AUGUST...AREAS OF THE SUN THAT PRODUCED HIGH FLUX LEVELS ON THE PREVIOUS SOLAR ROTATION HAVE COME AROUND ALMOST DEVOID OF ACTIVITY. THE RESULT IS THAT...IN THE SECOND HALF OF AUGUST...SOLAR FLUX LEVELS HAVE BEEN AS MUCH AS 50 POINTS LOWER THAN THEY WERE 4 WEEKS AGO. A LOW OF 101 ON AUGUST 28 WAS THE LOWEST SINCE EARLY MARCH...BUT READINGS IN THE 90S WERE RECORDED SEVERAL TIMES IN THE PEAK YEARS OF THIS SOLAR CYCLE.

THERE WAS NO VISIBLE EVIDENCE OF NEW ACTIVITY ON THE SUN AS THIS BULLETIN WAS IN PREPARATION...BUT SOLAR AREAS THAT PRODUCED THE MAJOR AUGUST RISE ARE COMING INTO VIEW AGAIN ABOUT SEPTEMBER 3. THEY COULD VERY WELL USHER IN THE AUTUMN DX SEASON OVER THE LABOR DAY WEEKEND.

THE PAST WEEK WAS MARKED BY SUDDEN INCREASES IN GEOMAGNETIC ACTIVITY... AND RESULTANT POOR HF PROPAGATION IN THE HIGHER LATITUDES. POOR CONDITIONS...LIKELY AUGUST 29 AND 30 WILL GIVE WAY TO MUCH BETTER PROPAGATION...AND HIGHER MUF...SEPTEMBER 1 TO 3. SEE QST PROPAGATION CHARTS FOR OPTIMUM TIMES FOR YOUR FAVORITE DX CIRCUITS AND FREQUENCIES. BEAR IN MIND THAT THE CHARTS ARE CONSERVATIVE AS TO MUF FOR THE BEST DAYS...BUT QUITE RELIABLE AS TO TIME AND PERIOD.

AMERICAN SUNSPOT NUMBERS FOR AUGUST 18 THROUGH 24 WERE BETWEEN 39 AND 64 FOR A MEAN OF 47.6.

Radio Shack can supply crystals for scanners other than their own brand. Yesterday, I got a look at a chart in a local Radio Shack that listed:

- frequencies of crystals that may be ordered
- scanners that work with Radio Shack's conventional crystals
- scanners that won't work with conventional Radio Shack crystals, but for which special crystals may be ordered

Crystals for Bearcat scanners[1] may be ordered from your local Radio Shack.

I referred a friend with a Courier Cop-Scan to the Shack. His special crystal order took all of 1 week to be filled.

Crystals for other uses[2] may also be ordered.

---

1. Bearcat scanners, as well as some J. C. Penny's models manufactured by Bearcat, use less common 10.8 MHz IF's

2. microprocessor clocks and CB radios for example

On June 29, 1983 the Space Shuttle was carried from Texas to Florida, piggyback on a Boeing 747. The frequencies used during this exercise were:

o+ 15.021 MHz

o+ 13.227 MHz

o+ 10.780 MHz

This information appeared in the September 1983 issue of the RCMA Newsletter.

Phil,

I will try to get a series of postcards sent to the early group of kitters.
It turnso out we have had delays in getting the PC artwork done, but it is
done now and we are expecting to build up a prototype next week. We had a pass
one prototype two weeks back and found a very minor problem which is corrected
on the new stuff.

Sorry about that. As usual, things don't always happen the way you want when
the alligators are biting...

Lyle

The best bet for obtaining the Vancouver implementation of AX.25 is to
write to Hank Magnuski, KA6M. He will send you a 8" CPM disk with source
in return for a modest donation to AMSAT.

The software may be distributed for noncommercial (i.e., amateur radio) use
but those receiving copies are also strongly urged to make a donation to
AMSAT.

DOC WILL CONDUCT AMATEUR RADIO EXAMINATIONS ACROSS CANADA ON OCTOBER 19. IF YOU PLAN TO WRITE, APPLY TO DOC BEFORE SEPTEMBER 21. THIS WILL BE THE LAST SET OF EXAMINATIONS BASED ON THE OLD TRC24.

DOC HAS SUPPLIED CRRL AND CARF WITH DRAFTS OF THE FINAL VERSION OF ITS NEW TRC24. THE TECHNICAL PORTIONS ARE NOW EXACTLY AS REQUESTED BY CRRL AND CARF IN THEIR JOINT SUBMISSION. THE NEXT TASK IS A REVIEW OF THE DOC QUESTION BANK.

REPRESENTATIVES OF CRRL AND THE CANADIAN CABLE TELEVISION ASSOCIATION HAVE BEEN MEETING IN OTTAWA TO TRY TO SOLVE AN INTERFERENCE PROBLEM IN VANCOUVER. THERE WILL SOON BE A JOINT MEETING WITH DOC, AND A STUDY OF FOUR CABLE SYSTEMS ACROSS CANADA, TO FIND OUT IF REGULATIONS GOVERNING CABLE TELEVISION RADIATION ARE REALISTIC AR

QST DE W1AW
HR PROPAGATION FORECAST BULLETIN NR 37 FROM ARRL HEADQUARTERS
NEWINGTON CT SEPTEMBER 12, 1983
TO ALL RADIO AMATEURS BT

BETWEEN AUGUST 19 AND SEPTEMBER 11 THE SOLAR FLUX APERAGED ONLY 109. THE MOST RECENT COMPARABLE LOW CAME BACK IN JWNUARY 1978. THIS INFORMATION HELPS TO EXPLAIN THE LESS THAN SPECTACULAR PERFORMANCE OF OUR HIGHER DX FREQUENCIES AT A TIME OF YEAR WHEN THEY ARE EXPECTED TO BE AT THEIR BEST. THIS LULL DOES NOT MEAN THAT THE 10 METER BAND WILL BE ONLY MARGINAL THIS AUTUMN. HIGHER SOLAR ACTIVITY CAN COME AT LEAST ANOTHER YEAR OF THIS SUNSPOT CYCLE, AND SEPTEMBER IS ONLY THE BEGINNING OF THE AUTUMN DX SEASON. EVEN 50 MHZ HAS BEEN OPEN FROM SOME SOUTHERN TIER STATES.

AREAS OF THE SUN RESPONSIBLE FOR THE LOW SOLAR FLUX WILL BE RETURNING TO VIEW LATE THIS WEEK. THERE IS SOME INDICATION THAT THEY WILL BE MORE ACTIVE THIS TIME AROUND. MORE ON THIS PROSPECT LATER THIS WEEK. WE WERE IN A PERIOD OF LOW GEOMAGNETIC ACTIVITY AT BULLETIN TIME. THIS SHOULD LAST THROUGH ABOUT THE 16TH, MAKING FOR GOOD SIGNALS ON ALL DX FREQUENCIES. HIGHER SIGNAL ABSORPTION AND POSSIBLE AURORAL EFFECTS ARE LIKELY THE 17TH THROUGH 23RD. BETTER OVERALL PROPAGATION AND HIGHER MUF ARE EXPECTED DURING THE FINAL WEEK OF SEPTEMBER AND MUCH OF OCTOBER AR

What John, KA9MNK said about the CIA opposing no-code could well
be true. The Aug or Sept issue of one of the Ham magazines has
a full page ad from the CIA wanting operators that can copy 12 wpm cw
and type 30 wpm. The starting salary was not very impressive......

Issues and NO Answers:

1) Does anybody know what happened to the rumored Icom IC-35 220 MHz rig? Has anybody in Net-land gotten a new Santec-220uP ? If so, how is it ? Does anybody have anything to say about the Yaesu Memorizer ?
2) I have seen references before on the net to a CB allocation in VHF or UHF range. Where, pray tell, is that, (so I can avoid it...).
3) Is there any packet activity which does NOT use HDLC chips and strange NRZI encoding ? This would be like RTTY - asynchronous 1200 baud, but have the protocol and packet structure. In other words, why do I have to buy a TAPR board to do packet ? I have a home system and a both a 202 and 212 modem - plug into my serial port, add some software, and presto: packets ! Any other standards or groups working on non-TAPR approaches ?
4) Are there any 2-meter FM DX nuts like me around Chicagoland who can give advice on antenna setup, linears, etc. I have a Kenwood 7950 (45 watts) and a Butternut Super-Trombone (5 dbd omni) whose base is at the 30 foot level (therefore the tip at the 46 foot level). I am going to be putting up a Power-Pack A147-22 sometime. Do all you guys hang out on 52 ? I heard a so-called FM DX net once, called and was either ignored or just didn't make it. Any operating info for a newcomer ?

According to Westlink, rumor has it the Central Intelligence Agency has
made it known to the FCC, in strong terms, that it feels the creation of
a no-code Amateur license would be detrimental to the public welfare.

The CIA apparently feels the Amateur population is a valuable source of already-
trained Morse-capable radio operators and, as such, is important to national
security.

Does anyone have any further information as to the truth of this rumor, or
details of exactly what the CIA told the FCC? Was this merely a recommendation
or was it an "offer they couldn't refuse?"

         73,
         John Opalko   KA9MNK

STS9 is now scheduled for a 11:30 am EDT liftoff
Oct. 28. The schedule for the whole mission is based on elapsed time of the
mission, so if there is a delay in the launch, the scheduled operating
time [of day] will change. But, the schedule based on elapsed time will
remain the same.
The orbits in the table are the only official operating times scheduled for
the mission. However, we must offer a word of caution ...
In the overall picture, amateur radio plays a very minor role.
Therefore it is likely that there will be adjustments to this operating schedule
once STS9 is in orbit. W1AW, W5RRR, and other NASA club stations will carry
the latest information as available.
ARRL is establishing phone lines with recorded information. (203) 666 0688
is the predicted number, but it might change. Westlink will be updating
the Hollywood number at least daily (213) 465 5550.
Assuming an 11:30 launch, the times for AOS listed in the table should be
accurate for the first city area.

Orbit	Date	City/Area	Time
39	10/30	Spokane, Denver, Dallas New Orleans, S. America, Houston	2000CDT
40	10/30	N. California, down Pacific co E. of San Francisco & L.A., Mexico	2000CDt 1930PDT
47	10/31	W. Australia, S. America, Europe	1430 UTC
63	11/1	S. America, USSR, India, Australia	1330 UTC
64	11/1	Iran, Scandinavia, USSR	1555 UTC
77	11/2	NW Africa, E. Europe, Poland, China	0850 UTC
79	11/2	N. tip of S. America, Caribbean, N. Europe, USSR, India	1250 UTC
80	11/2	Caribbean, all E. Coast states, Newfoundlan, U.K. central Europe	0815EST

I'm interested in connecting a device directly to the telephone line. I know about FCC part 68, and I'm curious about what steps (if any) a ham/hobbyist must take in order to receive the phone company's blessing prior to installing a phone patch. In addition, I'd appreciate any pointers/references/ correspondence concerning the general design of phone patches (a.k.a. Direct Access Arrangements). Does it make any sense to design your own? If not, who makes good patches and how much do they cost?

My application involves a speech synthesizer together with a DTMF encoder and a decoder, controlled by a microprocessor. The chips are as follows:

Chip	Description	Manufacturer
SC01A	Phoneme-oriented speech synthesizer	Votrax
5089	DTMF encoder	Mostek (among others)
203-P	DTMF decoder	Silicon Systems, Inc.

I have discovered very few references so far; these have been helpful:

Kuecken, John A., "Talking Computers and Telecommunications", Van Nostrand Reinhold, New York NY, 1983

Members of the Technical Staff of Bell Laboratories, "Engineering and Operations in the Bell System", 1977

Eisenberg, Albert J., "Telephone Coupling Transformers for Interconnect of Voice/Data Modem Terminals", Engineering Application Bulletin F232, Microtran Company, Inc., 145 E. Mineola Ave., Valley Stream NY 11582, 1977.

Kuecken's book contains a wealth of useful information concerning recognition of ring signal, dial tone, busy signal, etc.

Finally, there are many direct-connect modems currently on the market. Each
one of them must contain an FCC-approved telephone interface. Does anyone
have a schematic for any of these modems?

Unfortunately, high fees and rather restrictive technical
requirements make it generally impractical for an individual
to have equipment certified for direct telephone interconnect,
and only equipment so certified may be legally connected.

However, there are firms who sell already certified "interface
modules" specifically designed for interfacing non-certified
circuits to the telephone network. I believe that the cheapest
of these costs somewhere around $60 or $70, which isn't too
bad considering that it makes you completely legal from an
interfacing standpoint. Contact "Cermetek" up in Silicon Valley
for more info: (408) 734-8150.

DL Report Cites Failure Mechanism

After an extensive study of the circumstances surrounding the failure of
the AMSAT OSCAR 10 kick motor, AMSAT DL has released the following report.
The report is quoted verbatim except for minor editorial changes to
correct grammar, spelling, syntax, etc.

I. GENERAL
As a consequence of the collision of the third stage of Ariane L6 with
OSCAR 10, the orbit injection sequence had to be changed. This report
what has been accomplished and what problems were encountered.

II. PLANNED NOMINAL SEQUENCE
The spacecraft was designed to be separated from the launcher with a spin
rate of 10 RPM and an orientation such that a small motor-driven maneuver
could be performed on orbit 3. Following this maneuver, about four weeks were
scheduled for reorientation and calibration of the OSCAR 10 attitude

control system. When the correct attitude for a second spacecraft maneuver was attained, the spacecraft was to be injected into an orbit with 57 degree inclination and 1,500 km perigee.

III. ACTUAL SEQUENCE of EVENTS

After the collision with the launcher shortly after separation, OSCAR 10 was spinning at minus 2 RPM. The sun angle was approximately 70 degrees. This attitude resulted in the spacecraft temperatures being very much below specifications. Moreover, the power production was extremely low. The low spin rate in conjunction with the aerodynamic drag at perigee resulted in a daily improvement of sun-angle of about 3 to 4 degrees. It was thus decided to not adjust the attitude until the sun-angle had improved sufficiently to bring power production and temperatures again into specifications and until the sensors allowed unambiguous attitude determination.

These conditions were met one week after launch. At that time an emergency spin-up maneuver was intiated to allow the normal attitude control system to take over. The spin rate and attitude were adjusted to the first firing attitude until July 8. The first motor firing maneuver duration was increased because of the delay in first firing date and the consqential changes in sun-angle. The new post-first-firing values were to be 19 degrees inclination and 1,500 km perigee.

Local weather conditions at the primary control site prevented satisfactory telemetry reception on July 8 so the firing was moved to July 11. The first motor firin maneuver occured at 22:29 UTC. The motor performed flawlessly. However, it was later learned that the burn duration was 185 seconds rather than the planned 105.

The cause of the longer than planned burn was investigated and traced to a drawing error in the AMSAT-built Liquid Ignition Unit (LIU). The increased burn duration resulted in an orbital inclination of 25.9 degrees and a perigee height of 3,950 km. A secondary result of the extended burn was that the Helium bottle temperature dropped to minus 10 degrees C; again outside of its specifications.

One day later it was noticed that the low pressure Helium indication had dropped to one half of its nominal value while the high pressure reading remained about 200 Bars. Proceeding under the assumption the low pressure Helium gauge was at fault, we reoriented the spacecraft to the new firing attitude. On July 19 at 00:29 UTC the second firing was attempted. However, ever though the magnet activation was confirmed, no firing occured and ther were no changes in the indicated pressures.

Consequently, the spacecraft reorientation was initiated such that operations could commence August 6 at 18:00 UTC using the existing orbit.

IV. INVESTIGATION INTO the LOSS of HELIUM

Telemetry data from various control stations worldwide was collected until August 1 in order to recontruct the pressure history of the spacecraft. from the ddata collected it cn be unambiguously inferred that the Helium loss occured on the high pressure side of of the gas system and that the time

constant was 500 minutes. Furthermore, when the pressure fell below 7 Bars, the time constant changed to about 10 days. This finding rules out any leak in the motor or in the fluid tank system. An investigation with Messerschmitt-Boelkow-Blohm (MBB) on August 2 left only two candidate causes for the leak:

a) the seal of the Helium bottle
b) an "AN3" connection from the Helium pyrotechnic valve leading to a check point

Model Calculations and the observed behavior of the Helium seal in earlier tests led to discarding the "AN3" thoery as the causeof the leak. It is now concluded with a high degree of certainty that the Helium bottle seal caused the gas loss.

We believe the following conditions led to this gas loss:

1) The Helium bottle used in OSCAR 10 was developed by AMSAT DL with assistance from DFVLR [abreviation unknown- Ed] because the more conventional gas containers did not fit into the available physical space. The composite technology employed resulted in a bottle which could be specified for service only for temperatures above 0 degree C. Differential temperature expansion problems precluded hermeticity guarantees below 0 degrees C.

2) As a consequence of the poor sun angle subsequent to deployment, OSCAR 10 experienced a total of 14 cold cycles beyond its specifications early in its life. Some temperature excursions were to as low as minus 10 degrees C.

3) Shortly before the launch campaign, an error in the termal design was discovered. The error would have resulted in operating temperatures 10 degrees lower than the design target for OSCAR 10. Using the limited resources available at Kourou the design could be modified only to the extent that 5 degrees of the 10 degree error could be recovered. As a result, the spacecraft temperature is 5 degrees lower than originally planned.

4) The extended burn led to another low temperature cycle of the Helium bottle to minus 10 degrees C.

Each of these conditions would not, taken separately, resulted in a leak. However, the cumulative effect of the intial cold cycles probably reduced the tension of the hekium bottle seal to about one half of its design value. The temperature drop during the first burn plus the pressure change likely reduced the seal tension sufficiently to have causec the leak.

The following evidence supports this finding:

1) The Helium high pressure indicator exhibits a shift of the zero-line by about 200 Bars. This pressure gauge is a starin gauge affixed to the bottle. The observed shift evidences irreversible bottle dome material deformation.

2) The change in the leak time-constant at 7 bars can be explained by the fact that the bottle seal contains a Teflon O-ring which, from prior experience, is known to seal between between 5 to 10 Bars. (No such ring exists in the AN3 connection).

V. CONCLUSION FOR FUTURE PHASE 3 SPACECRAFT

a) The thermal design of the spacecraft will be changed to increase the temperature to a nominal design.

b) AMSAT will make every effort to replace the solid propellant motor planned for Phase 3C by the MBB liquid propulsion system. A solid propellant motor would not have survived the thermal abuse of OSCAR 10. The liquid propulsion system provided margins that were instrumental in saving the mission.

c) For Phase 3C, AMSAT will attempt to resdeign the Helium bottle such that its operating temperature can be specified to minus 10 degrees C.

VI. CONCLUSION REGARDING OPERATIONS of OSCAR 10

The present orbit of OSCAR 10 provides about 40 percent of the radio coverage compared to the originally planned 57 degree inclination orbit.

Furthermore, the low inclination forces antenna off-pointing and/or operational quiet times for about 40 percent of the time because of sun-angle constraints. Consequently, operational capability of OSCAR 10 is reduced to about one fourth of its planned value. Also, because of the 17 day periodicity of the satellite's footprint, unfortunate week-long interruptions in East-West traffic (e.g., over the North Atlantic) results.

On the positive side it may be noted that OSCAR 10 can meet all its scientific objectives and that the communications capability is so large that even one fourth of its nominal capability represents a very significant communication potential for amateur radio operators. This is all the more true since this is the first working spacecraft of this series and the users can take only previous OSCARs as basis for comparison. Plainly, OSCAR 10 presents a dramatic improvement.

I have some questions on TV components; 2 set couplers, splitters, etc:

I am trying to upgrade my TV antenna/distribution system in my house.
I believe I have adequate antennas. I use a midrange Radio Shack VHF
antenna and a separate UHF antenna, which is a 4-bay bow-tie. This
bow-tie has been cut to favor the part of the UHF band of interest,
which made a heck of a difference.

To combine the 2 antennas, I was told by an "expert" that I should use
a device called an "antenna coupler". It looks like the old 2 set couplers
with three sets of screws for the 2 inputs and output.

I originally thought that the best bet would be to use a VHF/UHF splitter
(backwards) but was told this did not work as well.

Does anyone know what this so-called "antenna coupler" is? I still think
the splitter is the way to go. A few years ago I helped a friend install
a new antenna and we borrowed a Jerrold field strength meter to find the

best spot on the roof. We also checked the loss thru the splitter at the set and found there was no noticable loss thru it. The signal on the UHF output port was the same as directly off the lead-in and it made no difference if the VHF port was properly terminated, open, or shorted. The same was true on the VHF port. So that is why I am inclined to think the splitter is best.

The "antenna coupler" does not distuingish between VHF and UHF inputs so it seems to me that it must be made like the ordinary 2 set coupler and would have 3 dB loss at each port......

Since I am trying to improve the signal level at each set (I need 3 locations) I can't stand the loss involved with ordinary passive multi-set couplers, however I have been reluctant to go to an amplifier since I know from other's experiences how badly they pick up undesired rf. (For example, All Radio Shack's antenna amps I have seen, oscillated and were really TVI prone). Any recomendations on antenna amplifiers would be appreciated.

(Yes, I could measure the loss of the antenna coupler, but I hate to tear into the system until I know what the final configuration will be).

Oh yes, another thing: I have always stuck with twinlead since (at least in dry weather) it is much less lossy than RG-59. All my sets have 300 ohm inputs anyway.

I live 40 miles west of Chicago and can almost see the Sears tower but am not impressed with the signal levels out here. Before stations went up there, signal levels on an average antenna system were only about 1000 uv on a 300 ohm antenna......

OK Morse fans, I am working on a code converter and need to know the
Morse characters for the following punctuation:

    Exclamation
    Quote
    Apostrophe
    long dash and short dash

    Tnx in advance,
    Bob, K9EUI

I have a question on the new FCC rule regarding PEP power measurement.
It seems to me the wording is aufully confusing on their definition
of what PEP is. I don't have the text of the Report & Order in front
of me, but in the same sentence they talk about "average", "crest"
and "peak". To me, PEP is not an average power but the instantaneous
peak at the crest (highest value) of the cycle. How does the word
"average" get into this??????????

A recent "net.ham-radio" reader asked for recommendations for 2 meter handie talkies1 (HT's) I recommend the Yaesu FT208R. I recommend this unit not NOT because I own it, rather I own it because I think it is one of the better units available.

It meets several of the criteria important to my needs:

o+ CTCSS - Ease of installing a synthesized CTCSS encoder. The FT208R has plenty of room set aside for just such an accessory, and a wiring harness that allows the encoder (or encoder/decoder) to plug right in.

o+ Battery replacement - The battery pack is a monolithic unit, and is easily replaceable. Flipping a lever on the bottom of the radio unlocks a battery compartment cover. This type of battery is used by several radios in the land mobile industry, hence replacement batteries are available from several battery manufacturers. Spectronics sells a replacement battery made by Alexander. It has 50 mah more capacity than the original Yaesu battery, and is a bit cheaper.

o+ Ruggedness - A heavy cast metal frame surrounds

the
radio. The top is metal, not plastic. The volume
and
squelch controls are of the conventional type, rather than type found in cheapie transistor radios which permit dust to enter the enclosure. The external appearance shows the designers paid attention
to details.
It's built "like a Swiss watch."

o+ Flexibility - For interface to the outside world, there are jacks for earphone, charger, external power (disconnects the internal battery)2, and external speaker/microphone. The antenna connector is a
BNC
type, rather than the 1/8" "earphone-type" jack on
the
Tempo units.

o+ Memory backup - The FT208R uses a lithium ("watch-type") battery to power the memory. By the time this battery needs replacement, I will have sold the HT!

---

1. handie talkie is a registered trademark of Motorola, Inc.

2. This is important. The batteries may be charged while powering the radio from an independent DC source.

Now for the negatives:

o+ The receiver does not provide sufficient audio output for use in noisy environments. The audio output on
the
Tempo S1/S5 is much more substantial.

o+ There is no memorization of transmit frequency offsets, as in the Santec ST144up. The user must make the proper selection via a rotary switch on the top of the radio.

o+ With ruggedness comes weight. This is not the lightest unit on the market.

o+ The scanning algorithm, like that found in most Japanese radios, could be better. There is no way to lock out channels from being scanned. The options for scanning for a clear channel, and scanning without stopping (even for a second!) are rather useless here. The priority scan feature acts differently than that of most scanning receivers3 and is not nearly as useful4.

Ten-Tec just announced their own, American made, 2 meter HT.
Shipments to stores are starting now. I saw this unit (serial number 8) at the Mid-Con show, and it looked promising. Some salient details:

o+ Its scanning algorithm resembles that used in the more traditional scanning receivers Americans have grown accustomed to.

o+ The case is entirely plastic.

---

3. The priority scan feature in the Bearcat 250, 20/20, 300, 350, 220, and the Regency K500, M100, and M400 samples the priority channel every 2 seconds. If there is activity on the priority channel, the radio locks onto it until the transmission is completed, then resumes listening on the channel that was interrupted.

4. The priority feature on the FT208R samples every 10 or 15 seconds, which is too infrequent. When activity is found on the priority channel, the radio locks onto it ... forever! The radio never resumes its normal activity.

o+ The battery pack is removable in the same manner as
that of the ICOM 2AT.

o+ There is almost no room for a CTCSS encoder, so Ten-Tec is designing one of their own.

As for future developments in this area, I think we will see:

o+ Improvements in battery technology, leading to longer times between recharging. Maybe we will see long life, throw away, battery packs.

o+ Multi band HT's for 146, 220, and 450 MHz.

o+ Multi mode HT's with SSB and FM.

o+ HT's with public service band receive capabilities built in, like the merging of an HT with a portable scanner.

I don't advise buying a used HT unless you have a comprehensive guarantee or trust the seller. Many amateur stores won't even take in used HT's on trade. They are difficult to service and suffer more physical abuse than base station and mobile radios.

A recent submission pertaining to trouble in a cordless telephone suggests:

"..... BUT** don't fret! a tune up on your phone by the factory or someone who knows what the're doing will cure your problem."

Cordless telephones, CB radios, and marine radios contain radio transmitters. Their design must be type accepted by the Federal Communications Commission (FCC).

According to the FCC, service on these units, as well as other transmitting equipment (other than ham radio equipment), MUST be performed by, or under the direct supervision of the holder of an FCC Radiotelephone License 2nd Class or higher.

Holders of these licenses are required to pass FCC tests in communications, electronics, and radio regulations.

I'm looking for a mobile 2m rig for my car. I've got a Toyota Celica, and
my present rig (an IC-25A) is too large to fit. I think that I'm really
after a rig with a control head which is small, and the rest of the guts under
a seat or in the trunk. It should be synthesized (of course!), and about
25W or so. Oh, for the days when we had GE Prog-Lines with control heads!

Subj: STS-9/W5LFL info

Following is info on STS-9/W5LFL received from W5RRR this PM:

W5LFL will be operational on a total of eight orbits (out of
a mission total of 145). Only three of these will serve the
continental U.S.

The following ascending node EQX info is based on a liftoff
at OCT28 1630UTC

Orbit 39	OCT 31	0103:42 UTC	241.50 W	(The midwest's only chance)
40	OCT 31	0233:04	264.20	(For the west coast)
47	OCT 31	1258:35	063.70	
63	NOV 1	1247:56	066.11	
64	NOV 1	1417:15	088.80	
77	NOV 2	0938:16	023.69	
79	NOV 2	1236:51	069.05	
80	NOV 2	1406:09	091.73	(For the east coast)

W5LFL will NOT be active during these entire passes, standby for
last minute scheduling. However, he WILL be active to provide
continental U.S. QSOs at the right times on orbits 39, 40 and 80.

Nodal period:	89.40 minutes
Long. Increment:	22.71 degrees/orbit
Average height:	249.5 Km
Inclination:	57 degrees

Keplerian elements (which have been checked through orbit 39
for reasonable accuracy using the W3IWI program)

EPOCH	1983 Day 302 1746:44.89 UTC
INCLINATION	57.0248 degrees
RAAN	178.60498 degrees
ECCENTRICITY	0.00083
ARG. of PERIGEE	001.86848 degrees
MEAN ANOMOLY	358.13682
MEAN MOTION	16.07142857 orbits per day
DRAG	0.030 (...a biggee!!)

SMA	6633.118215

These elements are for orbit 18. A nominal mission would include
only very minor maneuvering burns between orbits 18 and 80 which
means these elements may be useable without update (assuming
another FIRST CLASS NASA job).

That is (hopefully) all....

The power rule, as I would interpret it (not necessarily the same way
as the FCC) is that they are talking about peak average power, NOT
peak-instantaneous power. The hint of this is the "E" in PEP. It is
peak ENVELOPE power. The envelope is in that viewpoint of the waveform
where the signal is going up-and-down at the *audio* rate, not the
14 Mhz up-and-downing. It is this envelope that is 4x carrier power on AM.
"At" the peak of the envelope, you have MANY 14 Mhz cycles, and it it
the average power of this level (not peak instantaneous) that is being
specified. So you have (Erms)(Erms)/(Rant) =< 1500 Watts where Erms is at
the peak of the *envelope*. In the case of cw, the "peak" of the envelope
is when the key is down.

In regard to your statement that cordless phone repairmen need FCC
licenses, I was simply trying to help that person solve his problem.
However if you want to be that way, then since cordless phones are
also covered under FCC part 68, A FCC 2nd or 1st class license doesn't
mean diddly squat. Only the factory or it's authorized agent may repair
a phone. If you want to repair phones you need to send a repaired unit
in for FCC Part 68 testing and submit the data to the FCC and get
a FCC number to stick on the bottom of the phone.
Effective untill June 1985 a waiver has been issued
to cordless phone manufacturers allowing them a certain amount of
freedom to skirt around some of FCC part 15. This is why we are able
to pump so much power into the AC line (not antenna) and since an
antenna isn't used it is not strictly considered to be a radio
transmitter. It can generate interference an a label on the phone
says so (as per FCC part 15 subpart J). How would you like to have
to get a radiotelephone operators license to work on your computer?

An Oscar 10 program for the HP-41C was published in the March 1981
issue of Ham Radio, pages 46 through 50. "Tracking Satellites In
Elliptical Orbits", by Paul C. Bunnell, WA6VJR. I have not
tried this program. Has anyone had success???

The geometric equations were published in the article (ref. this newsnet

article 847) "TI-59 Program Tracks Satellites In Elliptical Orbits", by
Janos Molnar, Siofok, Hungary. This article was in the Oct. 6, 1981 issue
of Electronics, pages 146 through 149. I have not had total success with
this TI-59 program.

I bought a 2m HT recently, and it was a Kenwood TR2500. There were three major reasons for selecting it.

1. It had most all the whiz-bang microprocessor features that I wanted and was built nicely (bnc connector, mic./spkr extension plugs, etc). The only feature I wanted that it didn't have was that the ten channel memories didn't remember the split. This is not Kenwood's first HT, and unlike their older model, the split slide switch has -600 and +600 at opposite *ends* of travel, so the selection is easy. These little things are nice, but not necessary. Kenwood, at least on HF equipment seems (based on what stories I've heard)to have a good reputation for support when necessary.

2. Ergonomics. The thing you look at (LCD display) is at the top, and the thing I talk into (microphone) is at the bottom. My head is built in a manner that likes that arrangement.

3. The microphone is as far to the bottom as possible. This puts the antenna (which by the lightbulb & loop test radiates mostly from the bottom -- near the connector) as far away from my head as possible while transmitting. HT's with the microphone near the top put the antenna base much closer to the head, and in this "near-field" the field intensity is dropping off at least a cubed rate, and so the relative radiation through my head is much lower percentage wise with the microphone at the bottom. This might not be an ultra-important factor, but I am not inclined to be the top-microphone guinea pig to discover long term effects. Especially radiation to the head. I think speaker-mikes are not a bad idea.

Do we need to form a net.scanner? Come on, guys, surely there's more to life than eavesdropping on the cops.

This submission updates my previous article concerning experiences with the new Radio Shack PRO-24 pocket scanner.

On July 9, I returned the PRO-24 to the dealer from which it was purchased and received another one in exchange. This new one has a later serial number (210852) and was packaged in a red and white box. The original unit was packaged in a blue and white box.

The sensitivity of the replacement scanner is much better than that of the original unit, although still not quite as good on UHF as a friend's Fanon 6 channel scanner.

The holes on the belt clip of the new scanner are the proper size, as contrasted to the improper molding job done on

the
first one.

The squelch hysteresis was a problem on both scanners,
but
my original news item detailed a fix for that.

At 22:30:48 UTC this evening (11 July 1983) the Amsat-Oscar-10 kick
motor was fired for the first time. Firing duration was
107.52 seconds, and all telemetry indicates that the burn was
successful. While actual elements are not yet available, a simulation
based on nominal motor performance yields the following elements:

```
Epoch time:      83192.93930000
   Mon Jul 11 22:32:36 1983 UTC
Inclination:       17.7766 deg
RA of node:       248.7150 deg
Eccentricity:    0.6824060
Arg of perigee:   188.8217 deg
Mean anomaly:     181.4370 deg
Mean motion:    2.21235225 rev/day
Semi major axis: 24882.879 km
Anom period:    650.890923 min
Apogee:          35485.006 km
Perigee:          1524.555 km
```

There is more to scanners than listening to cops. An inexpensive
scanner can be used to monitor several ham bands at the cost of
only one receiver.
By the way, as soon as someone gets their hands on one of the new
Regency programable scanners I'd be most interested in seeing
comments and/or evaluations on it.....Dave Chasey -- WN9NBT

As I mentioned yesterday, we finally did our first motor burn.
Several hours afterwards, it became apparent that the burn had not gone
according to plan; loss-of-signal times were much later than expected,
indicating a burn that was too long.

This has been confirmed; the burn should have been 107 sec, while it was
in fact at least 190 sec. Why this happened is still a mystery;
telemetry shows the motor unit counting down from the larger number
even though a smaller number was supposedly loaded. The flight unit
had been extensively tested on the ground with no failures.

In any case, ranging over the last day has converged nicely into the
following set of elements:

```
Satellite: oscar-10
Catalog number: 14129
Epoch time:      83192.94024815
   Mon Jul 11 22:33:57 1983 UTC
Element set:         DC5
Inclination:       26.4198 deg
RA of node:       250.6344 deg
Eccentricity:    0.6055096
Arg of perigee:   185.6573 deg
Mean anomaly:     183.9066 deg
Mean motion:    2.05848339 rev/day
Semi major axis: 26106.161 km
Anom period:    699.544144 min
Apogee:          35535.588 km
Perigee:          3920.526 km
```

This is the FIRST time we have generated our own orbital elements
based totally on our own information and modelling; a lot of work
went into this part of the project and it has finally paid off.

As you can see from the elements, the perigee is much higher than
had been planned (1500 km); however, we still have more than half
of our "delta v" (kick motor capability) left, and we are now working
on a burn to bring us as close as we can to our desired final orbit.
Keep your fingers crossed.

Phil

In a continuing effort to provide frequency information of interest, I am posting an excerpt from Tom Kneitel's "Top Secret Registry of U.S. Government Frequencies" book:

Defense Civil Prep Agency: 10.493
Rockwell International: 16.587, 17.965
Lockheed Company: 6.659, 8.917, 11.194
Smithsonian Astrophysical Inst: 20.608
NASA: 4.486
FAA: 7.477, 8.125, 13.626
NORAD: 4.435, 9.023, 14.894
Space & Missile Tact Communic Net: 10.305
Disaster Radio Service: 1.762, 1.769, 1.776, 1.783, 1.790, 1.797

NOTES: all frequencies are in mHz, mode is SSB.

There are some very interesting frequencies contained in this book and others for FBI, Secret Service, White House, U.S. Border Patrol, Army Security Agency, Federal Martials, munitions factories, arsenals, etc.

I am interested in your views about posting these to the net. Do you think this proper?

According to Tom Kneitel's "Top Secret Registry of U.S. Government Radio Frequencies" book, the Federal Communications Commission (FCC) uses the following VHF frequencies:

o+ 41.060 - 100 watt mobile monitoring vans

o+ 127.125 - I presume AM is used on this frequency

o+ 167.05 - most field offices have repeaters on this frequency for use during inspections & investigations. Input frequencies are 172.05 and 172.80

NOTES: all frequencies are in mHz.

I think other newcomers or casual readers of "net.ham-radio" may be interested in my response to Tim Sullivan, who submitted the following query recently:

I have recently bought an auto with a german radio. The radio has scanning capabilities

for
both short wave and long wave (I assume this
is
what "LW" on the button stands for.)

My question is what capabilities do both options
have ? From reading previous articles, it sounds
as if my short wave can pick up police radios
but
this has not been done yet. On one clear night I
listened to what appeared to be a german radio
station, as everything spoken was german. The long
wave option hasn't picked up anything yet.

I would appreciate any advice that net.world could
give me. please send mail and I will post a
response for others who are interested. Thanks
in
advance.

Listening to radio signals on the short wave and long wave
bands is a fascinating hobby to many. Although you cannot
receive local police transmissions on your automobile radio,
you may be able to receive many interesting signals in
the
long wave and short wave bands. Police transmitters
use
frequency modulation (FM) in the VHF and UHF bands of 30 -
50, 150 - 174, and 450 - 520 mHz.

The long wave (LW) band (also known as low frequency, LF) is
used in many European countries as a regular broadcast band,
just like the 535 - 1650 kHz. medium wave (MW) band is
in
the United States. It is not uncommon to find capabilities
for this band provided in radios of European origin. When I
was a child, I always got a thrill out of tuning those large
German Grundig radios, which had an "LW" band position.
My
reception on LW with these radios was limited by the lack of
a suitable antenna.

The dials of some European radios indicate wavelength
in
meters rather frequency in kHz or mHz. To determine a fre-
quency in mHz, divide 300 by the wavelength in meters.

In this country, the long wave band is used for several
types of broadcasting, none of which is intended for
the
entertainment of the general public. Some stations you

may find on long wave include:

- radio navigation beacons - these stations usually transmit their 2 or 3 letter call signs in Morse code continuously, and are used by aircraft for radio location purposes.

- weather reporting station - an announcer reads the weather forecast continuously. Often times, the station's Morse code identifier will be noted in the background.

- wireless intercoms - some wireless intercoms work by modulating a carrier frequency in the LW band with the user's voice and using the house AC wiring as a transmission line. Sometimes, a small amount of this radiation escapes and may be received on a nearby receiver. I noticed this when, at age 11 I built my first radio. Its lowest coverage included the 200 - 400 kHz LW band. I used a wireless intercom and was able to hear myself on the newly assembled radio!

- experimental - there is even a license-free band from 160 - 190 kHz. which experimenters may use. They are limited to antennas less than 50 feet in length, and transmitters with less than one watt output.

The very low frequencies (below the capabilities of most car radio receivers) are used for such things as:

- communications with submarines - usually using very narrow shift radioteletype

- time standard signals - the U.S. National Bureau of Standards maintains a standard time station, WWVL, which transmits the exact time in Binary Coded Decimal (BCD) on 60 kHz.

- utility company control signals - some electric companies transmit control signals at very low frequencies, using the power lines as transmission lines. The

length of these power lines makes them act like antennas.

o+ long range navigation (LORAN) - a pair of powerful transmitters emit synchronized, pulsed signals. Ships may determine their (ship) position by using special equipment which analyzes the timing of the signals reaching the ship from the two LORAN transmitters.

Short wave, on the other hand, contains a larger variety of stations. A typical car radio will only be able to detect those which use amplitude modulation (AM). Such stations include:

o+ foreign broadcast - Voice of America, Radio Moscow, Voice of the Andes, Kol Israel, etc.

o+ time signals - WWV at 2.5, 5, 10, 15, 20 mHz. CHU (Canada) at 3.330, 7.335, and 14.670 mHz.

There are may other stations on short wave. Some use Morse code telegraphy (CW), which may sound like "thumps" in an AM receiver. Some use single sideband (SSB) voice, which may sound like Donald Duck in an AM receiver. Others use radioteletype (RTTY). Weather pictures are sent using facsimile (FAX).

Ham radio operators use all of these modes and more. The FCC has allocated 6 short wave bands for amateur usage. The short wave spectrum is used by ship-to-shore telephone, off shore oil rig platforms, spy stations, the military, embassies, the FBI, cordless telephones, CB operators, etc.

The radio antenna found on the typical car is a rather poor performer on LW, and not that much better on short wave.

The 4th edition of "The Top Secret Registry of U.S. Government Radio Frequencies", by Tom Kneitel (K2AES), sells for about $10 and is published by:

CRB Research
P. O. Box 56
Commack, N. Y. 11725

I've borrowed the 4th edition from the Bell Labs Indian Hill Technical Library. The new 5th edition, printed in about 3 weeks, will sell for $15, and I plan to order one.

CRB Research carries several other books, such as "Rail-Scan", "Air-Scan", "Confidential Frequency List", etc.

Many of these books are also available from Gilfer Associates, Park Ridge, N. J. (tel#: 201-391-7887). Gilfer also sells customized versions of general coverage receivers receivers (with special filters, modifications, etc.) and other hardware. I've done business with them before, and have received good service. You can order items through Gilfer over the phone using a charge card, if the order total is for more than $20.

WARNING: This article may not be of interest to electronic geniuses.

Have you ever used a tape recorder connected to your receiver to monitor those hidden frequencies? Hidden frequencies, to me, are those frequencies which may be used in an interesting way but are difficult to monitor because of infrequent usage.

Some of the higher quality scanners are equipped with tape recording interfaces. A few days ago, I connected a Panasonic cheapie cassette recorder, obtained by opening a savings account, to my Regency K500 synthesized scanner. The interface consisted of two parts:

1. audio - I installed a 1/8" jack on the rear of the scanner. I connected this jack, through a .01 ufd

disk capacitor to the high side of the volume control potentiometer. This provides a medium impedance audio output signal of constant level. That is, the level is independent of the volume control setting.

2. control - I installed a small relay in the scanner. The 12 VDC 1250 ohm relay coil is actuated by the carrier operated squelch signal.1 The contacts of this relay are brought out to a 3/16" jack on the rear of the scanner. These contacts control the power to the tape recorder.2

With this configuration, the recorder records only when a signal is being received on the scanner. Of course, if you had a fancier recorder, with voice actuated circuitry (VOX), you could just place the recorder's microphone near the scanner's speaker. With my particular configuration, I set the volume control on the scanner as low as it will go, pressed the record switch on the recorder, then went to sleep. When I awoke, I played back the tape.3 This is how I

---

1. A diode across the coil contacts protects the scanner's solid state circuitry against nasty reverse voltages.

2. As equipped from the factory, my K500 contained a control interface that could sink only 100 ma. I added the relay because my recorder used more current. I think the Bearcat 250's solid state control circuitry can sink 350 ma. The Bearcat 350 contains a relay which can handle 1 amp.

found some government stations mentioned in the Kneitel book.

It took a finite, but short, amount of time for the recorder's motor to come up to speed, so the first syllable of a transmission was missed occasionally. This produced a slight slurring sound on the tape in between transmissions, which helped separate one transmission from the next.

Scanners equipped with a "count" feature, such as the Regency K500 and Bearcat 250, contain a counter, the input of which is connected to the same signal that I used to activate the relay. One can get the scanner to display a count of the number of transmissions that took place on the frequency of interest since the last clearing of the counter. This counter provided me with more information. Needless to say, if it was zero after a long monitoring period, I didn't bother listening to the tape!

Try it and have some fun!

Robert S. Parnass, AJ9S ihnp4!ihuxf!parnass

---

3. The control interface circuit must be disconnected, or shorted (in my case) to play back the tape.

As I mentioned several days ago, the first motor firing which occurred on 11 July had been programmed for 107 seconds; the motor actually fired for 190 seconds. The reason for this has been determined to be a design error in the Liquid Ignition Unit (LIU) on the OSCAR-10 satellite which somehow escaped being detected during extensive testing.

The LIU is an autonomous hardware box which has direct control over the valves associated with the 400 Newton hypergolic liquid fuel kick motor. This motor burns a mixture of unsymmetrical dimethyl hydrazine (UDMH) and nitrogen tetroxide (N2O4), which are called "hypergolic" because they burn instantly on contact with each other without requiring a spark. The kick motor subsystem works as follows:

A high pressure bottle mounted in one of the arms was loaded with about 400 bar (1 bar ~= 1 atmosphere) of helium. The output from this tank goes through a pyrotechnic valve to a regulator which produces approximately 14.5 bar. From the regulator the lines split and pass to the two fuel tanks. Each pressurization line contains another pyro valve and a check valve, preventing fluid in one tank from backing up into the other. Pickup tubes in each tank lead to the engine firing valve, which is mounted on the engine itself. Another helium line runs to the engine, as the relatively large fuel valve is actuated by helium pressure controlled by a smaller electric solenoid.

The LIU functions (when its power has been turned on by computer command) by monitoring the computer-generated engineering beacon. Internal to the LIU are a set of PN (pseudo-random) sequence generators. In order to actually fire the valves or the motor, the computer must send the correct PN sequences, which are hundreds of bits long. These "keys"

are not present in the software at launch and were loaded only shortly before motor burn. This feature makes it virtually impossible for the computer to crash in such a way as to fire the motor accidentally.

The first job of the LIU is to fire the pyro valves (which can only be opened once and cannot subsequently be closed) thereby pressurizing the tanks. This was done successfully immediately before the first motor burn.

The second job of the LIU is to open the engine control valve (firing the engine) for precisely timed intervals. Again, this is done by decoding the proper PN sequence, which was followed immediately by an 8-bit quantity giving the burn duration in 2.56 second units. This byte is extracted from an 8-bit serial-in-parallel-out shift register and parallel loaded into a pair of 4-bit up/down counters. The engine valve is opened, a clock derived from the beacon bit rate counts the counter down to zero, and the valve is closed.

It turns out that an error in laying out the PC artwork in the LIU reversed the bit ordering between the shift register and the high order counter. I.e., instead of the bits being interpreted as 7 6 5 4 3 2 1 0, they were loaded as 4 5 6 7 3 2 1 0.

The programmed burn count was hex 2A (42 decimal, or 107.52 seconds at 2.56 sec/count). This was permuted into 4A hex, or 190 seconds.

We were quite lucky that a count with bit 4 high wasn't set, or the resulting burn would have depleted all our fuel. As it is, we can recover with the remaining fuel (about half) and attain an orbit fairly close to the originally planned one. Instead of an inclination of 57 degrees, we will be able to reach about 51, and the perigee height will probably be 2000-2200 km instead of 1500 km. We could bring the perigee back down to 1500 km "for free", but leaving it higher will help slow the precession of the apogee latitude which is otherwise increased by the low inclination. The net result of all this is that the apogee point will continue to occur in the northern hemisphere for only about 4-5 years instead of the originally planned 7.

Score: ESA 1, AMSAT 1!

Michel sent me this interesting background information:

"Tom Kneitel's "Top Secret Registry"

Does anyone remember this guy's column in Electronics Illustrated (does anyone remember Electronics Illustrated?)? Kneitel wrote a column called "Uncle Tom's Cabin" in which he gave wise-guy answers to legions of poor unsuspecting innocents who never seemed to catch on. Like Q: "Don't you believe in clubs to promote CB?" A: "Clubs, spears, dynamite - anything to silence the loudmouths who are ruining it for everybody else".

- Michel

Yep, I sure do remember reading Kneitel's column in "EI".

I don't know how to send electronic mail back to you directly. The heading on the mail you send me is a bit difficult to decipher. One interesting anamoly is that it came addressed to me @ BERKELEY! I have nothing to do with BERKELEY .... I'm here at BTL in Illinois! Please excuse the indiscretion of posting this to the net, but it may be of interest to others.

According to information printed in the July/August issue of "Monitoring Times" (vol 2, no. 4, published by Grove Enterprises, Brasstown, NC 28902), Electra Company demonstrated the following new scanners at the summer Consumer Electronics Show (CES) in Chicago:

o+ BASE - BC-151 synthesized 16 channel for 30-50, 138-174, 406-512 mHz. Features: vacuum fluorescent readout, delay, lockout. List: $250. (Looks like the same plastic cabinetry used on the recent BC-200 scanner. Nice to have coverage of the secret government and military frequencies between 406 and 420 mHz.)

o+ MOBILE - BC-260 synthesized 10 channel mobile unit, with all metal cabinet and mounting bracket. 3 watts audio output! Features: Memory backup, vacuum fluorescent display with dim switch, electro-luminescent keyboard backlighting, audible "chirp" keyboard feedback, priority, weather key (nice!), search, lockout. Cost: $400. (Low profile cabinet with front mounted controls ... a new breed from Bearcat.)

o+ PORTABLE - handheld BC-5/6 crystal controlled 6 channel unit. Features: low, high, aircraft, and UHF bands, 300 mw. audio output, individual LED channel indicators, scan delay, lockout, BNC terminated flexible antenna, belt clip. Comes with AC adapter and NiCd batteries. Cost: $180. (Nice to see a BNC connector on a handheld scanner!)

A free sample of "Monitoring Times" magazine is available by calling Grove Enterprises at (704)837-2216.

A one year
subscription to this bimonthly publication is $9.50.

According to "Monitoring Times" Magazine, Electra
is
introducing the DX-1000, a new synthesized, general coverage
receiver, manufactured overseas for Electra.

It covers 10 kHz through 30 mHz, with direct keyboard entry
plus knob tuning. The receiving modes are AM, FM, USB, LSB,
and CW. Ten (10) memory channels are provided,
along with
selectable filters, 12/24 hour clock, multi-
frequency/multi-time automatic record control. Up/down
frequency step size is selectable in increments from 1 to 99
kHz (I guess one can't step in 100 or 10 Hz., pity).

The list price is about $600, and it sounds like a
competitor for the Kenwood R-2000.

I've sent for brochures on this new radio and other Bearcat
offerings.

The DX-1000 at least has a vernier even though the "steps" are 1 kHz.
The R-2000 does not have a fine tune and the "steps" are 50 Hz, I think.
That makes the R-2000 a poor choice for anyone interested in RTTY!

During the past week, AMSAT-Oscar-10 has been on "autopilot". That is, the onboard computer has continued to spin up the satellite and reorient it for the second kick motor firing. The target spin rate is about 50 rpm. This figure is high to provide enough centrifugal force to ensure that the fuels in the half-empty tanks are properly picked up by the engine feed tubes.

There is one worry having to do with telemetry readings of decreasing helium pressure. Several days after the first burn, a sudden drop from about 15 bar to 6 bar was seen on the output of the helium pressure regulator, followed by a slow decline to about 4 bar now. The reason for these readings is still not know for sure, but there are several plausible possibilities:

1. The readings are false and there is no leak.

2. There is an actual leak somewhere between the helium tank, the regulator output and the three-way check valves which lead to each fuel tank and the engine control valve.

3. There is a leak in the plumbing associated with one of the fuel tanks, or perhaps in the regenerative cooling jacket which passes UDMH fuel over the engine bell, possibly caused by the collision with the launcher.

There are problems with each of these theories. The pressure sensor is a high-reliability unit that cost something like $350. You'd expect something that expensive to work right! If there was an actual leak, you'd expect a smoother, exponentially decaying pressure curve instead of the sudden drops we've seen. If #3 were right, we would have lost much of our fuel immediately after the collision and the first motor burn shouldn't have worked.

#2 is considered the theoretically most likely possibility, considering the reliability and complexity of the various components. If this is the case then things aren't all that bad. The fuel and oxidizer tanks, which are 20 liters each, are currently half empty. Assuming that the check valves (which are safety rated) hold, the helium already in each tank should keep them pressurized at 15 bar. The engine could still be fired in a "blowdown mode", utilizing this trapped helium pressure. Emptying the tanks would only double the ullage (empty space), resulting in a tank pressure drop to only 7.5 bar, enough to keep the engine going although not at maximum efficiency.

The second burn is tentatively scheduled for 01:13:50 UTC on 25 July (Sunday evening USA time). Listen to 3850 khz for real-time information.

After the burn, whether it works or not, the spacecraft will be reoriented to an operational attitude and the transponder switched on for open use. The end is near!

_C_h_i_n_a_.

BY1PK was operated for one hour on July 7 by K1MM. Although many stations were worked, only one continental U.S. and one European were contacted. Bill hopes that with this break further operations will be allowed. He reports that BY1QH is at a university fifteen miles from Beijing and will soon be active. Without the city's high noise level, DX should be easier to work. Six thousand amateur operators are now qualified in China.

_K_e_r_m_a_d_e_c__I_s_l_a_n_d_.

VK9NS reports a very favorable letter received from the authorities. He has begun DXpedition planning.

At 00:32:00 UTC today, 26 July, an attempt was made to fire the motor on
Oscar-10 for the second time. This burn was planned to deplete our fuel,
raising inclination to 50 degrees and lowering perigee to about 2100 km.

At the proper time the electrically operated auxiliary valve was
opened, and this was confirmed by telemetry. However, no changes in

helium pressure or bottom surface temperature were seen, and the computer closed the valve one minute later as it was programmed to do in the event this happened.

It appears that the helium pressure readings we had been seeing in the past weeks since the first motor burn were valid and that there was insufficient helium to open the main engine valve, preventing us from firing the engine. The main valve is specified as requiring 5 bar of helium pressure to open, while the regulator output pressure reading at the time was about 3.6 bar.

The most likely cause according to MBB, the manufacturer of the engine, is damage to the welds on the engine's regenerative cooling jacket caused by the collision with the Ariane at separation. Either the leak did not form until after the first burn, or the small size of the leak combined with the relatively low vapor pressure of UDMH (the fuel) kept enough fuel in the tank to allow us to do the first motor burn. Once the tank had been pressurized to 15 bar, however, the leak rate increased to the point where either the fuel was expelled or helium escaped, depleting the helium tank.

My personal theory, although not widely held, is that the slow leak existed from the time of the collision. The nice thing about this theory is that it also explains why the delta-v (change in velocity) in the first burn was higher than even the longer burn duration should have given. If fuel had been leaked, this would result in a smaller spacecraft mass and therefore a larger velocity change for a given thrust and duration. The regulator pressure readings during the first burn, which were normal, would be explained by no gas being lost from the leak until most or all of the liquid had been expelled.

All is certainly not lost, however. The first burn put us in a very stable orbit in which atmospheric drag is negligible. The rest of the satellite appears perfectly functional, and it will now be reoriented to operating attitude. It will take perhaps a week to point the high gain antennas at earth, followed by another few days for transponder checkout, and the satellite will become available for general use.

There will be some side effects of this orbit that aren't particularly severe, but will have to be lived with:

1. The inclination (approx 26 deg) is low enough that at certain times of the year the high gain antennas will have to be off-pointed from the earth in order to maintain acceptable sun angles on the solar panels. This is likely to be more of a nuisance than a real problem, however, and would have had to be done for the first year even if we had reached the desired orbit until the apogee point had precessed far enough north to make this unnecessary.

2. There will be slightly more radiation in this orbit. It is not known exactly how long the satellite will survive, but it will still most likely be measured in years.

3. The argument of perigee will precess much faster, but this is mitigated by the fact that apogee will never move further north than 26N or further south than 26S. The rate of precession is about .272 deg/day, which means that the first northernmost apogee will occur in a little less than a year. After another year apogee will be back at the equator, a year later it will be at 26S, etc.

4. The long DX possibilities for high latitude stations will decrease. In the ideal "Molniya" orbit, long mutual 3-way visibility windows would exist between, say, Tokyo, London and New York. These windows will be shorter and less frequent in this orbit.

5. The southern hemisphere gets a much better deal. The low inclination will not penalize stations in the southern hemisphere as much as the apogee moves north.

6. There is still probably half a tank of corrosive nitrogen tetroxide on board. While the tanks were designed with considerable margins of safety, it is not known how well the N2O4 tank will hold up over a period of years.

In any event, the satellite should finally be operational soon, albeit in an unplanned orbit!

Immediately after the unsuccessful second kick motor firing attempt, the satellite was commanded to reorient to the operational attitude with the antennas pointing at the earth. To allow for reorientation and transponder checkout, a date of August 6 has been selected for the start of general operations. The initial schedule will favor the mode B (70cm->2m) transponder, with occasional operation of the mode L (23cm->70cm) transponder to be announced.

Watch this space or the CW message on the General Beacon at 145.810 mhz.

I would like to know if anybody has had TVI problems, specifically with the IC-730. I've had problems on 10 and 15 meters even though I used the standard methods of eliminating TVI. (lo-pass, grounds,etc.)

The only method which seemed to improve the problem was to enclose the rear of the rig and power supply in a metal box.

Anyway, I would like to hear from other hams who have had and solved or not solved TVI problems.

(I also would like to know how many hams are on the net. This is my first time posting an article)

An unexpected launch opportunity has occurred with NASA-DELTA due to the premature demise of NASA'S LANDSAT-4 spacecraft and their decision to advance the call-up replacement mission to early next year rather than in late 1985 as previously planned. The original launch date had made it appropriate to earmark this opportunity for the PACSAT mission, however the advanced date has brought the launch well in front of the earliest time that PACSAT could possibly be ready.

Discussions with the GSFC NASA DELTA Project Office indicate strongly that this is the last low, polar, earth-orbit launch currently scheduled using the DELTA vehicle and therefore it would seem a pity to let it pass unused. The only remaining tangible launch opportunities left after DELTA reside with the STS Get Away Special programme (using the Thiokol ejection mechanism based on the DELTA/UOSAT interface). The first likely launch of the Shuttle into a useful polar orbit is scheduled for August 1986.

The result is that there is a definite launch opportunity for a UOSAT class spacecraft on board a DELTA vehicle into a 854 km, 103 minute, sun-synchronous (9am-9pm), polar, earth orbit currently scheduled for March 1984.

In spite of the extremely tight timescale, and following discussions with AMSAT and the PACSAT project, a proposal to prepare a UOSAT-B spacecraft for this launch opportunity is being prepared by the UOSAT team at Surrey.

As will be understood, many hurdles stand in our way that impact the already short timescale - not least of all finance! It is not possible to release further details at this time as the project is under study and the proposal not yet prepared and submitted to NASA-HQ.

Details on the proposed mission (if all continues well) will be published as soon as possible.

AMSAT Oscar-10 is still scheduled to begin mode B operations at 1800 UTC
on 6 August, 1983. The reorientation maneuver is somewhat behind the
simulations at this point, however the decision has been made to keep to
the turn on schedule. For this reason signals may be initially somewhat
lower than expected, but will improve quickly as the spacecraft
approaches the correct attitude.

hr arrl bulletin nr 64 from arrl headquarters
newington ct july 28, 1983
to all radio amateurs bt

the fcc has released a report and order terminating pr docket 82624
and amending the rules in parts 2 and 97 pertaining to amateur
transmitter power limitations. effective august 29, 1983, most
amateur power limits will be expressed in terms of peak envelope
power.   the new rules impose a 1500 watt peak envelope power output
limit on the majority of amateur transmissions. however, operators
employing am double sideband voice may continue to use the present
1000 watt dc input terms until 1990. the new rules also place a 200
watt pep output limit on transmitters operating in novice subbands,
replacing the present 250 watt dc input limit. additionally,
effective radiated power has been redefined in terms of pep output
from the transmitter. the special power limits at 1900 to 2000 khz
have been specified in pep output figures, and power limits for 450
mhz transmitters located around certain military installations have
been redesignated in pep output terms.   details to appear in
september and october 1983 qst   ar

hr arrl bulletin nr 66 from arrl headquarters
newington ct july 28, 1983
to all radio amateurs bt

amsat attempted to fire the oscar 10 onboard kick motor for the final orbit adjustment at 0032 utc on july 26. the firing command was transmitted and received but the motor did not fire. amsat speculates that when the ariane 3rd stage collided with oscar 10 about 53 seconds after separation back on the june 16 launch day, helium pressurization plumbing was damaged. helium under pressure is used to operate the engine valves and to mix the hydrazine fuel oxidant. without pressure, the motor was unable to fire. therefore, amsat oscar 10 is in its final orbit.

though not the orbit intended by amsat, oscar 10s present orbit is a very useful one that will provide long distance and long duration communication for many years. arrl congratulates amsat on its tremendous achievement and its professionalism in circumventing many obstacles in reaching this final orbit. we wish them many years of continued success as oscar 10 becomes operational.

orbital parameters. inclination 25.87 degrees, eccentricity 0.60434, 2.06 orbits per day, 699.546 minutes per orbit, 35500 km apogee and 3951 km perigee. typical access time in north america is ten to eleven hours per day ar

hr propagation forecast bulletin nr 31   from arrl headquarters
newington ct august 1, 1983
to all radio amateurs bt

the solar flux dipped to a low of 119 on july 27, but then began to
rise rapidly. by july 31 it was up to 153, its highest level since
early june. it appears likely to go higter, and remain above recent
levels through the first two days of august. as has been stated in
recent bulletins, this rise is unlikely to make a marked difference
in our summertime dx conditions.

the condition of the earths magnetic field is of more importance at
this season. it has been erratic in the past week, and propagation
has been more than normally variable. a more calm period is due
august 1 and 2, but erratic propagation is expected again august 3 to
6. sporadic e skip is still with us, but it will become less common
in early august. high latitude f layer propagation will improve and
the muf will be moving higher after mid august.

american sunspot numbers for july 21 through 27 were between 61 and
124 with a mean of 90.7 ar

The Mode B (70cm up, 2m down) transponder was turned on for general use
yesterday as scheduled. The spacecraft is using the omnidirectional
antennas as the attitude is not yet correct for the high gain arrays.

The satellite is performing quite well, despite the expected weak
signals and QSB. Quite a lot of DX has been worked: ZL, PY2, KL7,
H44, etc. The omni is quite "deaf" and best results are being had by
those running on the order of 500 watts out on 70cm. When the satellite
came back down from apogee late last night (and shortly after AOS this
evening) signals were very strong due to the reduced path loss and
favorable antenna angles. KA9Q even made his first SSB contact running
only about 40-50 watts to a KLM 18C antenna. We expect that the
satellite will perform this well at apogee once the high gain antennas
are turned on.

The most interesting phenomenon has been the quarter-second round trip
delay. It makes sending CW tricky; you have to turn up the keyer
sidetone and concentrate on it lest you be fooled by your own delayed
downlink. I've found it hilarious listening to the newcomers on SSB
monitoring their own downlinks ("Hellllloooooooooo Seeeeeeeeeka...
kaaa.... kewwwwwwwwwwww.....") and sounding just like the "drunk" victims
of the old tape-delayed-speech parlor trick!

See you on the satellite!

Phil Karn, KA9Q

With the launch of Amsat Oscar-10, problems have arisen with terrestrial interference to the Mode B (145.8-146.0) downlink. Many hams have become accustomed to operating FM simplex in this range. However, the ARRL 2-meter bandplan designates the 145.8-146.0 mhz range for Amateur Satellite use only.

Most amateurs gladly move to different frequencies once they are informed about the satellite and why the segment needs to be kept clear. In my own case, the local radio club had its simplex net frequency on 145.800 mhz. After I announced that Oscar-10 was operational, the club eventually moved to a new frequency. Not only that, I was invited to give a talk on AMSAT at a special club meeting!

However, there do seem to be a small number of amateurs who, despite having been politely informed that they are interfering with satellite communications, refuse to move out of the downlink passband. For this minority, there may be legal recourse.

On page 63 of the August QST, the Washington Mailbox column quotes an April 27, 1983 letter from the FCC to a repeater council:

"The only national planning for Amateur Radio Service frequencies that has come to our attention is that done by the American Radio Relay League. The 1982-83 edition of the ARRL Repeater Directory lists over 5600 stations in repeater operation all over the United States and Canada. In view of this widespread acceptance of their band plans, we conclude that any amateur who selects a station transmitting frequency not in harmony with those plans is not operating in accord with good amateur practice. [For example] The ARRL Repeater Directory lists the frequency pair 144.83/145.43 MHz as a repeater channel. Therefore, designation of the channel by the regional frequency coordinator in [an] area is in accord with the ARRL national band plan."

The article goes on to state:

"The bottom line is that if stations transmit on frequencies 144.83 or 145.43 (to use the Commission's example above), in a manner that creates interference to coordinated repeaters, then sufficient cause would exist for issuance of an Official Notice of Violation of Section 97.78. And, such operation could mean an additional Notice for deliberate and malicious interference (97.125)."

If you are having problems with local interference to Oscar-10 in your area, I would recommend that you first try the diplomatic approach. If you're lucky (as I apparently have been) and get a chance to explain what's going on, you might even find a few of the people asking furtive questions about 70cm antennas, amplifiers, etc! Only when all else fails should you bring up the fact that the FCC appears willing to back up the ARRL band plans.

Good luck.

Greetings. I'm not completely sure that I'm hitting the correct
newsgroups with this message... but it's the closest I can come!

Originally I wasn't going to post this information to the net, but
I've been encouraged to do so by several individuals who felt there
might be general interest.

I have recently been offered what I consider to be a ridiculously low
purchase price for standard 4 Ghz (C-band) video satellite earth station
equipment. I follow prices in this area closely, and I have reason to
believe that the price I'm now seeing will not go lower for similar
equipment for a long time, if ever.

However, to take advantage of this opportunity, I need to find
a number of individuals or companies (the more the better) who would
be interested in the same equipment, so that a reasonable group purchase
can be made. However, the purchases must be on file before August 15
or the opportunity is lost.

I've been considering the purchase of such equipment (for general
experimentation, mostly) for quite some time, but felt that the cost
of a decent system was still too high. The current system, though
by no means "deluxe", appears to be a damn good compromise at an excellent
price, and I'd hate to let this chance slide by.

Anyway, the basic system includes an 11 foot aluminum dish (12 petals
for easy transport), 80 degree LNA (much better than the usual 120 or
(rarely) 100 degree units that are typical), dish-mounted downcoverter,
electronic polarizer (no moving parts), receiver, polar mount, cable, etc.

The basic price being offered to me is around $1150 for this package,
but I can't afford to move on this by myself. So... if you know anybody
who has been considering a similar purchase but didn't want to spend
$3K-$4K+ for most commercial units, please let me know by direct
mail as soon as possible -- maybe we can all get together and make
something happen. Thanks much.

For the first time tonight, the regular weekly AMSAT net held on 3.850
mhz was "simulcast" on Amsat-Oscar-10 at a frequency of 145.957 mhz.
Signals were good despite the high gain antennas still not being
oriented for optimal performance; the reorientation still has about 50
degrees to go. I made a tape with the net control station WA2LQQ
"direct" on 75m on one channel and the satellite downlink with its
quarter second delay on the other; it makes for an interesting effect!

Antenna reorientation is expected to be complete on Thursday.

73, Phil KA9Q

Lines: 63

This news item concerns Kenwood 2 meter transceivers. It:

- Describes a problem with the final amplifier in a Kenwood 2 meter rig.
- Solicits comments from other Kenwood users.
- Mentions a modification to increase the scanning rate in the Kenwood TR7800.

I have been using a Kenwood TR7800 2 meter transceiver since September 1980. It has given good, reliable service up until yesterday, when the RF output of the transmitter began to disappear.

The transmitter works fine for about a minute, then the output goes flat. If the rig is turned off, and allowed to cool, I can repeat the cycle over again. The culprit appears to be the large, unserviceable, rectangular module, designated M57733. This module contains the driver and final amplifier transistors, and bolts to the rear heat sink. Four wires emanate from this module:

- RF input
- RF output
- DC power for driver stage
- DC power for final stage

Kenwood quotes a price of $55 + $2.50 shipping for a replacement part. I believe a similar module was used in the earlier Kenwood TR7625, which has a bad reputation for failure of this component. Has anyone had similar experiences with TR7800's, TR7850's, TR7625's, etc?

The August 1983 issue of 73 Magazine contains an article outlining a TR7800 modification which speeds up the scanning rate. Most control functions in the TR7800 are handled by a microprocessor. The clock for the microprocessor consists of an LC circuit. The author doubled the clock frequency by removing the slug in the clock inductor.

I applied this simple modification to my TR7800. It works, and as a side effect, all the other operations controlled by the micro are sped up also!

There is more to scanners than listening to cops. An inexpensive scanner can be used to monitor several ham bands at the cost of only one receiver.

By the way, as soon as someone gets their hands on one of the new
Regency programable scanners I'd be most interested in seeing
comments and/or evaluations on it.....Dave Chasey -- WN9NBT

holmdel, new jersey, u.s.a.
hr arrl bulletin nr 30 from arrl headquarters
newington ct april 18, 1983
to all radio amateurs bt

astronaut owen garriott, w5lfl, will operate an amateur radio station
aboard the next space shuttle mission, scheduled for september 1983.
on april 16, nasa officially approved a joint arrl/amsat proposal to
include an amateur station aboard the sts 9/spacelab flight. the
joint arrl/amsat proposal calls for arrl to furnish the special

amateur radio equipment for use on the shuttle, and to organize and
coach amateurs in procedures for rapid and efficient communications
with the shuttle. this operation, which will be on 2 meter fm, will
mark the first time in the history of space exploration that the
general public will be able to communicate directly with an astronaut
in orbit. details will be forthcoming in qst ar

FEDERAL COMMUNICATIONS COMMISSION
Washington, D.C. 20554

In the Matter of)
) PR Docket No. 83-28
Establishment of a Class of)
Amateur Operator License Not)
Requiring a Demonstration of)
Proficiency in the International)
Morse Code.)

COMMENTS OF MR. PHILIP KARN, KA9Q

I have been a licensed amateur for 12 years, 10 as an Amateur Extra Class licensee. During this time, I graduated from high school, obtained Bachelor's and Master's degrees in Electrical and Computer Engineering, and obtained a professional position with Bell Telephone Laboratories. I consider the technical knowledge and motivation for learning gained through amateur radio to have been a strong factor in my choice of a career in the communications and computer industry.

During my years as an amateur, although I have contributed to public service (e.g., Civil Defense) activities, my primary interests have always been technical: new communications modes, techniques, and higher frequencies. I am currently involved in two new technologies: packet radio and amateur satellites, as an Assistant Vice President for Engineering with the Radio Amateur Satellite Corporation (AMSAT).

This is an exciting time to be involved in such activities. As technology advances, distinctions between formerly separate disciplines become ill-defined. A whole new range of interdisciplinary opportunities (e.g., the proposed PACSAT store-and-forward packet radio satellite) are only now beginning to appear. The realization of these potentially substantial contributions to the state of the art depends almost entirely on the availability of motivated and technically knowledgeable amateurs, and the voluntary financial support of a large user population.

As one who has both professional and amateur interests

in
communications, I am constantly struck by the contrast between the people in my two environments. On the one hand, a disturbingly large fraction of radio amateurs with access to the spectrum appear relatively uninterested in advancing the state of the art. On the other, many of my non-amateur colleagues also have a personal interest in radio communications. While they certainly have the capability to make significant contributions to low-cost implementations of advanced technologies, they are barred from the spectrum by even the 5 wpm code requirement associated with the Technician Class license.

I have often tried to encourage interested colleagues to obtain amateur licenses. The replies are often along these lines:

1. "I don't need or want to learn the code; I just want to experiment with packet radio". [or, satellites, microwaves, etc]

2. "Why should I want to be part of a service that's snobbish enough to insist that everyone learn the code?"

3. "Nobody does anything technically innovative in the Amateur Service. I wouldn't have anybody to work with."

These three reasons reinforce each other. Opportunities for innovation are often missed because many "technical types" aren't hams. They resist what they perceive as an arbitrary requirement kept in place by an elite group more intent on maintaining their "exclusive rights" than in advancing the state of the art. While I usually point out that CW is still a useful mode in many situations, even in advanced systems such as OSCAR satellites, I cannot help but agree that the code should not be a mandatory entrance requirement.

I therefore strongly support the Commission's desire to create a form of "code free" license and am deeply disappointed that the ARRL and the majority of my fellow amateurs appear to disagree with this position. My only concerns are practical: while there is general agreement that the "microwave bands" (1215 Mhz and up) could easily

support many more amateurs, it is not as clear with regard to the 50-450 Mhz bands.

For this reason, I feel that if the Commission adopts any code-free proposal, it should also do the following to

alleviate congestion if at all possible:

1. Grant no new services access to the 220 Mhz band.

2. Maintain the use of 420-430 Mhz by the Amateur Service.

3. Expedite the allocation of additional VHF/UHF spectrum to the Amateur Service, particularly the 902 Mhz WARC-79 band.

Even with additional VHF/UHF frequencies, simply removing the code test from the Technician license would likely result in severe overcrowding on the popular 144 Mhz band. Overcrowding, such as that in Southern California, not a lack of code proficiency, is the major cause of accidental and intentional interference. It therefore unfortunately becomes necessary to limit access to 144 Mhz, but I cannot justify the code requirement on its own merits for that band any more than I can for the less crowded higher frequencies.

The best way to limit crowding on 144 Mhz while still encouraging talented newcomers and the use of the higher amateur bands would be through two types of code free license. The lower grade would require only the theory test associated with the Technician license and provide all

privileges on 220 Mhz and up. The higher grade would grant all privileges above 50 Mhz to licensees who demonstrate a knowledge of theory equivalent to that required of Advanced or Extra Class licensees. I would recommend that the Commission reserve the option to later modify requirements for this grade of license, based on actual experience.

While a "digital" specialty license would undoubtedly appeal to a number of potential amateurs, I feel that it would be too restrictive. Such a license would ignore the needs of potential amateurs interested in other areas, such as microwaves and satellites, and isolate those who do obtain the "digital" license from the rest of the amateur community.

Summarizing my suggestions, I would create two classes of code free license as follows:

Class	Privileges	Theory Test
"second"	all on 220 MHz and up	Existing Technician/General
"first"	all on 50 MHz and up	Existing Advanced (or Extra)

Subject: Phase 3-B Launch Campaign Status
X-Google-Info: Converted from the original B-News header
Posted: Sat Apr 23 15:23:31 1983
Received: Mon Apr 25 01:46:24 1983

The following is a status report on the AMSAT Phase 3-B/Ariane L-6
launch campaign:

Report from Kourou 17:30 UTC 23 Apr 83
{De Gordon and Jan via FY0ESE, 21.360 MHz, to WA2LQQ}

1. Preparations of the s/c are going well.
2. A slip in the launch appears inevitable. The magnitude of the slip
   is indeterminate at this moment. Could be 1 week to 5 weeks or more
   pushing launch date into August.
3. There are two significant problems:
   a. Turbo pumps [no elaboration given on the air]
   b. Inertial nav system [likewise no elaboration]
4. Our crew will complete all preparations up to s/c fueling. They will
   then return home for an indeterminate period. About one week's work
   will be needed upon return to Kourou.
5. A major review/meeting will be held tomorrow, Sunday.
6. The next major decision point is 16 May 83 [launch day set then?]
7. Jan would like to QSO with both KA9Q and W0PN on Sunday, 24 Apr.
   Suggest they tune 21.360 o/a 1700 UTC.
8. Jan will call [LL] WA2LQQ on Monday.

This info is suitable for public dissemination for release now.

_S_p_r_a_t_l_y__I_s_l_a_n_d_s_. It has been reported from Hong Kong that DJ6SI and DF6FK, along with the skipper and one other crew member, were rescued at sea by a Panamanian ship, the Linden. The four were discovered in a lifeboat, approximately 100 miles west of the Spratly Islands. They are expected to arrive in Hong Kong Friday or Saturday. Tragically, the two other amateurs on the DXpedition, DJ3NG and DJ4EI, have died, one in the initial attack and the other at sea a few days later. Actual details of the attack are still not known at this time.

_D_e_s_e_c_h_e_o__I_s_l_a_n_d_. The FCC has changed the prefix of Desecheo Island from KP4 to KP5.

_T_u_r_k_e_y_. ARRL Headquarters has received word from the Turkish Amateur Radio Club that the government has passed legislation officially recognizing amateur radio once again. The process will take about six months, at which time amateur radio will be legal by government standards.

_B_r_u_n_e_i_. VS5MS can be found on 14210 kHz at 1430Z.

_G_a_b_o_n_. TR8JD operates around 21300 kHz at 2130Z. QSLs are being handled by F6AJA.

_S_t_.__M_a_r_t_i_n_. K6GXO/PJ7 is active on 21290 kHz at 2100Z. QSLs go to his home QTH.

_W_e_s_t__M_a_l_a_y_s_i_a_. Look for 9M2SQ on Sunday mornings at 1030Z around 14210 kHz.

_A_f_r_i_c_a_/_S_o_u_t_h__A_t_l_a_n_t_i_c_. An informal group meets on 21335 kHz between 1700 and 2000Z. ZD9, ZD8, ZD7, TJ, TQ, TU, and 7Q7 stations are available regularly.

_U_z_b_e_k_. An extremely active station is UI8OAA, whose QSL manager is I8YGZ.

_S_t_.__V_i_n_c_e_n_t_. J88AQ may be found on Saturdays on 21300 kHz around 1700Z.

Did anybody else go out there and brave the floods?

Just returned from an exhausting weekend. The outside flea markets were only open on Saturday and Sunday, while the commerical exhibits (inside) were open all three days. It also rained two out of the three days; guess which ones? Parking was a disaster; because of the rain, the usually spacious unpaved fields behind the arena were closed, and people were parking anywhere and everywhere. Tow trucks were out in

force, and I'm sure the local auto pound made plenty of money.

A lot of new amateur transceivers are coming out with provisions for computer control. The cheaper rigs provide only for frequency control, while the more expensive ones allow you to get to more of the knobs from the interface. Yaesu has the TS-980 and the FT-757GX with their "CAT" (Computer Assisted Tuning), while a number of Icom transceivers have had accessory connectors allowing external frequency control for some time. Seems to me that shared club HF "remote base" stations should become quite common.

Multiband VHF/UHF rigs (some supporting full duplex cross banding, e.g., for satellites) are starting to appear; both Yaesu (FT-726R) and Kenwood (TS-780) have them. The Yaesu looks especially nice because you can choose the three bands segments you want as plug-ins. More and more 70cm multimode rigs are also appearing, but most seem to restrict you to only a 10 mhz segment of the band (440-450 mhz, or, more commonly, 430-440 mhz). 1.2 Ghz stuff is just now starting to appear; Icom has a 1.2 Ghz mobile FM transceiver, and more 1.2 Ghz transverters and transmitting converters are coming out, many especially designed for the 1269 mhz Phase 3B Mode L uplink. Technology moves on!

Phil

Does anyone in the Naperville, Illinois area know of a local store that stocks and sells scanner crystals for Bearcat scanners for Naperville Police and Fire Departments frequen-

cies?

The radio stores in Chicago only stock crystals for towns close to the city, and Radio Shack stores stock crystals for their scanners only.

Thanks,

Bob Parnass, AJ9S
Bell Laboratories

_S_o_u_t_h__C_o_o_k__I_s_l_a_n_d_s_. ZK1CG, Victor, is again active and is providing a new country for many on 160 meter ssb. Watch 1812 kHz at 0730Z.

_T_a_h_i_t_i_. FO8JP is active daily on 40 cw as well as 20 and 15 meter ssb.

_A_m_s_t_e_r_d_a_m__a_n_d__S_t_.__P_a_u_l__I_s_l_a_n_d_s_. FB8ZQ can be found on 7003 kHz at 0030Z and will also make skeds for 80 meters. QSL to F6GXB.

_B_r_u_n_e_i_. VS5MS is on 14210 kHz at 1200Z. QSL via N2OO.

_N_a_m_i_b_i_a_,__S_o_u_t_h_w_e_s_t__A_f_r_i_c_a_. ZS6BPJ/ZS3, Karel, can be found on 7005 kHz at 0530Z. He is also active on 28030 kHz and

has been looking for contacts on 160 meters.

_G_a_b_o_n_. TR8JD can be found on 14044 kHz at 0045Z.

_C_h_i_n_a_. BY1PK and BY8AA have been heard in QSO with each other on 14058 kHz at 0050Z. The operators at BY8AA are Lml and Xxan.

#N:whuxlb:6200001:000:700
whuxlb!mkg May 8 00:06:00 1983

While watching the cartoons this morning, I was suprised and pleased to see CBS news do one of their "In the News" spots on ham-radio. They couldn't say much in 60 seconds but they touched upon public service (showing shots of a ham in Hawaii next to the lava flow with an HT), the Dayton hamfest (a shot of your 'typical' hamfest visitor decked out with radio gear), talked about AMSAT and the station that Garriott will bring on his future shuttle flight, and a brief but adequate description of the hobby while showing somebody making contacts from Dayton.

All in all, it was an oustanding display of ham radio. If only we could get more publicity like that!!!

Did anyone in the area notice a VHF opening this weekend?
Sunday morning several of the higher TV stations had some
high-quality skip here (Ft Collins, Colo). I have 2 reasons
for asking, one that I enjoyed VHF right up until grad school
(now almost over, Praise the Lord!) and I will be back into it soon.
Secondly, if I heard of/discover how reliable TV is as an
indicator, I may be able to note the prime skip later on when
I am active again. Any notes and observations are welcome..

By the way, for those of you doubtful of our second try on "that damn
French rocket", I have learned that we are carrying insurance this time.
The provisions (as I remember them, I might be slightly off) state that
we reach a final orbit with an inclination greater than 30 degrees,
apogee between about 35,000 and 40,000 km, perigee greater than about
1,000km, within 60 days of launch. Since it will require the kick motor
to give us this kind of orbit, the insurance has the effect of also
guaranteeing that our spacecraft is functional and commandable, and the
kick motor firings have the desired effect. The price? The insurance
"leverage" is 8:1, i.e., $1 of insurance buys $8 of coverage. I believe
we are insured to about $250,000, roughly the actual out-of-pocket
expenses (but not the value of volunteer time) required to build the
spacecraft.

Keep your fingers crossed.

28 MAY 83

INTERCONTINENTAL PACKET RADIO TESTS SUCCESSFUL

At approximately 23:00 UTC on 27 May, a successful digital packet radio QSO was held between Tom Clark, W3IWI in Maryland and Ian Ashley, ZL1AOX near Auckland, New Zealand on 28 MHz. This 13850 km path represents the longest distance yet bridged using packet radio. Both stations were using the Terminal Node Controller (TNC) developed by the Tucson Amateur Packet Radio group in conjunction with home built S-100 computers. The QSO used Freq uency Shift Keying (FSK) techniques at a data rate of 1200 baud.

Although propogation conditions were marginal, data exchanges consisted of "beacon" transmissions and two-way connection ack nowledgements using the amateur AX.25 HDLC protocol; with this protocol messages are sent repeatedly until they are successfully acknowledged by the other station.

Also participating in the test was Bob Diersing, N5AHD in Corpus Christi, Texas; W3IWI and N5AHD have held several successful packet radio QSO's. N5AHD monitored the beacon and text transmissions from both W3IWI and ZL1AOX.

All three stations involved are affiliated with AMSAT and have been experimenting with high speed digital transmissions in anticipation of conducting similar activities with AMSAT's Phase-3B satellite due to be launched in the near future, and with AMSAT's PACSAT packet radio satellite now being designed.

Official P3B Bulletin #001
DTG 1 Jun 83 1545 UTC
FT 1 Jun 83 1720 UTC
RLSD WA2LQQ

TO: QST (For general dissemination)
FM AMSAT HQ

Per W3GEY this date: Launch date may still be 15 Jun 83. However, according to F8ZS (CNES IG) and NASA Tracking (per W3IWI), 16 Jun 83 is planned date.

Clearly, either date looks possible now. Decision point arrives 6 Jun 83.

Flight readiness review 31 May affirmed launcher readiness without exception.

P3B S/C is fully fueled with propellant. Electrical systems A-OK too.
S/C will be mated to Sylda tomorrow (Thursday). Fully fueled (wet) weight
was measured as 128.83 kg according to W3GEY.

Reminder to listen to Honeywell net on repeaters nationwide 2 Jun. W1JR
is featured. AMSAT bulletin will be included by W0RPK.

A message from the UoSAT folks at the University of Surrey:

> The bulletin/telemetry/digitalker program which showed memory error correction on UoSAT during the weekend has been re-run today and displays no further problems, at a preliminary glance. It seems that a byte became corrupted during the program execution and this was continually accessed, toggling the error counter, until successfully re-written at the re-load. Further telemetry on Thursday morning (GMT) will confirm this diagnosis.
>
> G8NEF, G8NOB, University of Surrey.

Note from KA9Q:
This message refers to an apparent primary computer memory problem that
appeared last week. The 16K byte primary computer memory, which consists
of twelve 4116 dynamic rams, uses a Hamming error-detection coding scheme.
Whenever a read cycle is done, the hardware checks the redundant bits
and produces a correct data byte even in the event of a single bit
error. The computer continues to work normally, except that a three bit
hardware counter (displayed in the telemetry) is incremented. There
should have been a software routine periodically scanning memory, rewriting
any bad locations, but it had apparently not been loaded. The cause of the
"continuous errors" was probably due to either the memory being commanded

off and not being reinitialized, or to a single soft error perhaps due to a radiation particle. The Phase 3-B onboard computer uses an identical memory system design and UoSAT is serving as the first flight application of this technique.

Phil Karn, KA9Q

Official AMSAT Bulletin #002
DTG 2 Jun 83 1830 UTC
FT 2 Jun 83 1842 UTC
RLSD WA2LQQ

TO: QST
FM: AMSAT HQ

Per W4PUJ at Kourou. P3B S/C is complete. All preparations have been successfully accomplished and the S/C is in excellent health.

The S/C has been mounted in the Sylda and AMSAT can no longer touch P3B.

The Sylda gets "put together tomorrow" according to W4PUJ. It will be rolled out to the pad on Monday.

In sum, AMSAT's job is complete.

Lots of picture taking is going on says W4PUJ.

"The spacecraft is beautiful," sys Dick, W4PUJ.

The launch is scheduled for 16 June according to W4PUJ. This conforms to AMSAT HQ assessment made from various sources including NASA and CNES. (Cf P3B #001)

Further bulletins as available.

R E M I N D E R Don't miss the Honeywell net tonite. W4PUJ will report via tape (to W0RPK) on the launch status Listen on your 2 meter repeater for the report as part of the main program featuring W1JR.

P3B is 14 days away!

HR ARRL BULLETIN NR 40 FROM ARRL HEADQUARTERS
NEWINGTON CT JUNE 2, 1983
TO ALL RADIO AMATEURS BT

THE FCC HAS LIFTED CERTAIN AMATEUR RULE RESTRICTIONS. EFFECTIVE JUNE 15, 1983, AMATEURS USING RADIOTELEPRINTER CODES OR FAST SCAN TV WILL NO LONGER BE REQUIRED TO IDENTIFY IN INTERNATIONAL MORSE CODE OR PLAIN LANGUAGE VOICE. IF USING BAUDOT, ASCII OR AMTOR, STATIONS MAY IDENTIFY USING THE PARTICULAR DIGITAL CODE BEING USED FOR THE COMMUNICATION. IF USING OTHER DIGITAL CODES ABOVE 50 MHZ, STATIONS MAY IDENTIFY USING BAUDOT, ASCII OR AMTOR. FAST SCAN TV TRANSMISSIONS MAY BE IDENTIFIED IN VIDEO USING THE U.S. 525 SCAN LINE STANDARD DESCRIBED IN PART 73 OF THE FCC RULES. THE CW OR PLAIN LANGUAGE VOICE IDENTIFICATION REQUIREMENT WILL STILL APPLY TO FACSIMILE AND SSTV TRANSMISSIONS. AMATEURS WILL HAVE THE OPTION TO CONTINUE USING CW OR VOICE ID AS AT PRESENT FOR RADIOTELEPRINTER OR FAST SCAN TV. ALSO, THE MAXIMUM FREQUENCY SHIFT FOR DIGITAL COMMUNICATION WILL BE RAISED FROM 900 TO 1000 HZ IN THE HF BANDS. ABOVE 50 MHZ THE MAXIMUM SHIFT WILL DEPEND OF THE SIGNALLING RATE USED. THESE CHANGES DO NOT BECOME EFFECTIVE BEFORE JUNE 15. DETAILS WILL APPEAR IN THE LEAGUE LINES FOR JULY QST AR

to all radio amateurs bt

the fcc has lifted certain amateur rule restrictions. effective june
15, 1983, amateurs using radioteleprinter codes or fast scan tv will
no longer be required to identify in international morse code or
plain language voice. if using baudot, ascii or amtor, stations may
identify using the particular digital code being used for the
communication.   if using other digital codes above 50 mhz, stations
may identify using baudot, ascii or amtor. fast scan tv
transmissions may be identified in video using the u.s. 525 scan line
standard described in part 73 of the fcc rules. the cw or plain
language voice identification requirement will still apply to
facsimile and sstv transmissions. amateurs will have the option to
continue using cw or voice id as at present for radioteleprinter or
fast scan tv. also, the maximum frequency shift for digital
communication will be raised from 900 to 1000 hz in the hf bands.
above 50 mhz the maximum shift will depend of the signalling rate
used. these changes do not become effective before june 15. details
will appear in the league lines for july qst ar

No, if I remember correctly, Bell's Theorem merely states that no theory which is:

1) local - i.e., if any thing happening at point A is to affect something at point B, any "signal" must pass through all the intermediate points at a finite speed.

2) realistic - i.e., says that the underlying variables of the theory (position, momentum, field strengths, etc.) must have values independent of the observer.

can NOT exactly reproduce the predictions of quantum mechanics. Therefore, if somebody concocts a local, realistic theory, there must be an experimental test to tell whether it or quantum mechanics is correct. In fact, there have been several such tests; all but one validated quantum mechanics, and the other one is in doubt.

This does NOT mean that "nature is not local", i.e. you can send "signals" at infinite speed or via "action at a distance". It merely says "nature is either local or realistic, not both". I'm not familiar with the mechanics of the theorem, so I'm sure I'm leaving out other conditions (i.e., "nature is not local, realistic, and ... all together").

To   : All Packeteers
>From   : Paul Rinaldo, W4RI (ARRL HQ)
Subject: FCC Relaxes Rules -- No need to cw i-d on packet

We received the verbatim text of an FCC release of yesterday. Although individual packet stations are relieved of the need to send cw i-d, I would certainly encourage the retention of cw i-d for all packet repeaters and packet beacons. That would help packeteers tell which repeaters are available to them and would help propagate the faith to current non-packeteers.

Here it is:

Before the
Federal Communications Commission FCC 83-247
Washington, DC 20554 33301

In the Matter of)
)
Amendment of Part 97 of the)
Commission's Rules Pursuant to the)
Commission Regulatory Review)
Program.)

ORDER

Adopted: May 26, 1983 Released: June 1, 1983

By the Commission: Commissioner Fogarty not participating;
Commissioner Sharp absent.

1. Pursuant to the Commission's Regulatory Review program, the rules addressed herein are being amended or deleted, as appropriate, in order to eliminate unnecessary restrictions and rules, codify requirements of the Communications Act of 1934, as amended, or make editorial corrections necessary for simplifiction or clarification of the rules. The affected rule sections are: ~ 97.13, 97.32, 97.61, 97.69, 97.81, 97.84, 97.99 and 97.173.

2. We are deleting ~ 97.32(f), which currently prohi-

bits the renewal of Interim Amateur Permits, since renewals may be justified in circumstances where there is an extraordinary delay in the issuance of permanent amateur operator and station licenses.

3. We are revising ~ 97.13(c) and ~ 97.13(d) to correct an omission in order that amateur operator license renewal applicants may submit a photocopy of their license in place of the original document. We are deleting ~ 97.67(a)(3), and revising ~~ 97.61(e), 97.69(a)(2) and 97.67(b)(3) in order to rectify certain unintentional inconsistencies in our recent Order authorizing the use of the digital code "AMTOR" on Amateur Radio Service frequencies below 50 MHz. /1/ We are revising ~ 97.99 to delete the reference to the obsolete Form 452-C. We are also revising ~ 97.173(d) to change the incorrect reference to ~ 97.41 to the correct reference, ~ 97.42.

4. We are adding a new paragraph to ~ 97.81 which codifies into the rules the existing requirements of the Communications Act of 1934, as amended, that specify that the Commission has the "...authority to inspect all radio installations ... which are subject to the provisions of any Act, treaty, or convention...." /2/ This amendment also codifies longstanding Commission policy in that the authority to inspect amateur radio stations is a general condition of grant of all amateur licenses.

5. Finally, we are revising ~ 97.84 to allow station identification for amateur stations to be made by video when specific transmission standards are used, or, under some circumstances, by using certain common digital codes. This will relieve a number of burdens amateur operators have faced when required to identify "packet radio" transmissions, television transmissions where audio cannot be practically transmitted on the same operating frequencies, and transmissions where international third party traffic is exchanged and identification of the station being communicated with is required. /3/

6. We are dispensing with the prior notice and comment procedure provisions of the Administrative Procedure Act (APA) in this proceeding since the subject rule changes are either interpretative (~~ 97.13, 97.69, 97.81, 97.99) or relate to agency procedure (~ 97.32), or since it is unlikely that any objections would be received in view of the obvious benefits which are being conferred and we, therefore, find it unnecessary (~~ 97.61, 97.69, 97.84, 97.99). /4/ The APA's effective date requirements are also not applicable to these rule amendments because they either relieve a restriction, or are interpretative. /5/ Certain rule changes also addressed merely make editorial corrections and the APA, therefore, does not apply (~ 97.173).

7. Inasmuch as general notice of proposed rule making is not required, the Regulatory Flexibility Act of 1980 does not apply.

8. Accordingly, IT IS ORDERED That, effective June 15, 1983, Part 97 of the Commission's Rules and Regulations, 47 CFR Part 97, IS AMENDED as set forth in the attached Appendix. This action is taken pursuant to authority contained in Sections 4(i) and 303 of the Communications Act of 1934, as amended. Further information on this matter may be obtained by contacting: Maurice J. DePont, (202) 632-4964, Federal Communications Commission, Private Radio Bureau, Washington, DC 20554.

FEDERAL COMMUNICATIONS COMMISSION

William J. Tricarico
Secretary

Attachment: Appendix

/1/ 48 FR 7457 (February 22, 1983).

/2/ See Section 303(n) of the Communications Act of 1934, as amended.

/3/ Article 25, ~ 5 of the International Radio Regulations (Geneva, 1979) permits identification signals in the form of, among others, "a telegraph code compatible with conventional printing equipment." Furthermore, the television emissions which we are authorizing to be identified by video are those which can only take place on frequencies where international propagation is unlikely.

/4/ See 5 U.S.C. 553(b)(3).

/5/ See 5 U.S.C. 553(d).

APPENDIX

Part 97 of the Commission's Rules and Regulations, 47 CFR Part 97, is amended as follows:

1. In Section 97.13, paragraphs (c) and (d) are revised to read as follows:

~ 97.13 Renewal or modification of operator license.

(c) Application for renewal and/or modification of an amateur operator license shall be submitted on FCC Form 610 and shall be accompanied by the applicant's license or a

photocopy thereof. Application for renewal of unexpired licenses must be made during the license term and should be filed within 90 days, but not later than 30 days, prior to the end of the license term. In any case in which the licensee has, in accordance with the provisions of this chapter, made timely and sufficient application for renewal of an unexpired license, no license with reference to any activity of a continuing nature shall expire until such application shall have been finally determined.

(d) If a license is allowed to expire, application for renewal may be made during a period of grace of five years after the expiration date. During this five-year period of grace, an expired license is not valid. A license renewed during the grace period will be dated currently and will not be backdated to the date of its expiration. Application for renewal shall be submitted on FCC Form 610 and shall be accompanied by the applicant license or a photocopy thereof.

2. In Section 97.32, paragraph (f) is deleted in its entirety.

3. In Section 97.61, the parenthetical phrase in paragraph (e) is revised to read as follows:

(when type F1 or A2J emissions are employed in these bands, the radio or audio frequency shift, as appropriate, shall not exceed 1000 Hz)

4. In Section 97.69, paragraph (a)(3) is deleted in its entirety and paragraphs (a)(2) and (b)(3) are revised to read as follows:

~ 97.69 Digital communications.

(a) * * *

(2) When type A2, F1 or F2 emissions are used on frequencies below 50 MHz, the radio or audio frequency shift (the difference between the frequency for the "mark" signal and that for the "space" signal), as appropriate, shall not exceed 1000 Hz. When these emissions are used on frequencies above 50 MHz, the frequency shift, in hertz, shall not exceed the sending speed, in baud, of the transmission, or 1000 Hz, whichever is greater.

(b) * * *

(3) The International Radio Consultative Committee (CCIR) Recommendations 476-2 and 476-3 (commonly known as AMTOR); provided that the code, baud rate and emission timing shall conform to the specifications of CCIR 476-2 (1978) or CCIR 476-3 (1982), Mode A or Mode B.

5. Section 97.81 is revised to read as follows:

~ 97.81 Authorized apparatus.

(a) An amateur station license authorizes the use, under control of the licensee, of all transmitting apparatus at the fixed location specified in the station license which is operated on any frequency or frequencies allocated to the Amateur Radio Service, and, in addition, authorizes the use, under control of the licensee, of portable and mobile transmitting apparatus operated at other locations.

(b) The apparatus authorized for use by paragraph (a) of this section shall be available for inspection upon request by an authorized Commission representative.

6. In Section 97.84, paragraph (g) is revised to read as follows:

~ 97.84 Station identification.

(g) The identification required by this section shall be given on each frequency being utilized for transmission and shall be made in one of the following manners:

(1) By telegraphy using the international Morse code (if this identification is made by an automatic device used only for identification, the code speed shall not exceed 20 words per minute);

(2) By telephony using the English language (the Commission encourages the use of a nationally or internationally recognized standard phonetic alphabet as an aid for correct telephone identification);

(3) By telegraphy using any code authorized by ~ 97.69(b), when the particular code is used for transmission of all or part of the communication or when the communication is transmitted in any digital code on frequencies above 50 MHz; or

(4) By video using readily legible characters when A5 emissions are used, the monochrome portions of which conform, at a minimum, to the monochrome transmission standards of ~ 73.682(a)(6) through ~ 73.682(a)(13), inclusive (with the exception of ~ 73.682(a)(9)(iii) and ~ 73.682 (a)(9)(iv)).

7. In Section 97.99, the introductory paragraph is revised to read as follows:

~ 97.99 Stations used only for radio control of remote model

crafts and vehicles.

    An amateur radio station in radio control operation with a mean output power not exceeding one watt may, when used for the control of a remote model craft or vehicle, be operated under the special provisions of this section, provided that a writing indicating the station call sign and the licensee's name and address is affixed to the transmitter.

     8. In Section 97.173, paragraph (d) is revised to read as follows:

~ 97.173 Application for RACES station license.

    (d) If the application is for a RACES station to be in any special manner covered by ~ 97.42, those showings specified for non-RACES stations shall also be submitted.

The recent posting of the complete text of the changes to part 97 regarding
cw id regulations prompts me to ask if anyone has a computer readable
copy of the entire text of part 97.

Thanks in advance,
73, Jim KY2D ABI Holmdel ...!hou5f!jak

160 Meters (Illinois) A1 and A3 only

KHz	Day power	Night power
1800 - 1900	1000	1000
1900 - 1925	500	100
1925 - 1975	100	25
1975 - 2000	500	100

6 and 2 Meters:

50.0 - 50.1	A1 only
51.0 - 54.0	A0, A1, A2, A3, A4, A5, F1, F2, F3, F4, F5
50.1 - 54.0	A1, A2, A3, A4, A5, F1, F2, F3, F4, F5
144.0 - 144.1	A1 only
144.1 - 148.0	A0, A1, A2, A3, A4, A5, F0, F1, F2, F3, F4, F5

The bandwidth of an F3 emission below 29 MHz shall not exceed that of an A3 emission.

The "Considerate Operators Frequency Guide"
(Frequencies generally recognized for certain activities)

1800 - 1825	cw only	14.08 - 14.10	RTTY
1825 - 1830	dx window	14.23	SSTV
1850 - 1855	dx window	21.09 - 21.10	RTTY
3610 - 1630	RTTY	21.34	SSTV
3637.5	AMTOR	28.09 - 28.10	RTTY
3845	SSTV	28.68	SSTV
7090 - 7100	RTTY	29.30 - 29.50	SATELLITES
7171	SSTV	29.52 - 29.58	RPTR inputs
10.14-10.15	RTTY	29.60	FM simplex
14.075	AMTOR	29.62 - 29.68	RPTR outputs

DIGITAL COMMUNICATIONS: (F1, 3.5-28 MHz)(A2, F1, F2 above 28 MHz)

BAUDOT: (International Alphabet #2)
A2, F1, F2: Maximum frequency shift = 1000 Hz.***
A2, F2: Highest modulating frequency = 3000 Hz.
Maximum speed = 100 wpm (75 baud).

ASCII: Maximum baud rates:
3.5 - 28 MHz = 300 baud
28 - 50 MHz = 1200 baud
50 - 220 MHz = 19600 baud
220 - up = 56000 baud

AMTOR: TOR specifications are found in CCIR Rec. 476-2.
(100 baud, Block rep rate 2.222/sec.)

NOTE: Above 50 Mhz, the frequency shift in Hz shall not exceed the sending speed, in baud, or 1000 Hz, whichever is greater. ***

OTHER DIGITAL CODES: (ABOVE 50 MHZ ONLY):
Any other digital code may be used above 50 MHz in the domestic U.S. (Except where A1 only is permitted). A description of the code and modulation technique must be kept in the log.

Bandwidth limitations:
50 - 220 MHz = 20 kHz max.
220 - 1215 MHz = 100 kHz max.
1215 and up = any Bw if in accordance with 97.63(b) and 97.73(c).

NOTE: When using digital communications, CW or phone ID is no longer required after June 15, 1983. The ID may be given using Baudot, ASCII, or AMTOR.

FACSIMILIE and TELEVISION:

Below 50 MHz the bandwidth of A4, A5, F4, F5 must not exceed that of an A3 SSB signal.

50 to 225 MHz:
The bandwidth of A4 and A5 SSB emissions must not exceed that of A3 SSB emissions.

The bandwidth of A4 and A5 DSB emissions must not exceed that of A3 DSB emissions.

Type F4 and F5 emissions shall be limited to a peak deviation of 5 KHz with a maximum modulating frequency of 3 KHz. Alternatively, the bandwidth shall be no greater than 20 KHz.

Below 225 MHz, type A4 and A3 or type A5 and A3
emissions are allowed simultaneously on the same
frequency if the bandwidth is no greater than type
A3 DSB.

Note: Fast Scan television transmissions may be
identified using "readily legible characters
when A5 emissions are used". ***

FM: AMSAT HQ
RLSD: WA2LQQ

According to the schedule briefed 2 Jun by W4PUJ, the P3B S/C should have been buttoned up in the Sylda and the ECS-1 mated to same on Friday, 3 Jun. On Monday the payload will be rolled out and mated to the launcher.

All is going extremely well and hopes are high. The 16 Jun schedule is holding now but the REAL decision date is 6 Jun. On 6 Jun ESA will decide if 16 Jun is viable.

The support crew will be returning to their respective homes today, Saturday. W3GEY and W4PUJ are expected Saturday evening. ZS1FE left Friday (?). DJ4ZC and all but two of the DL crew will leave today as well. Jan speculates that Ulrich (DK4VW) and Wolfgang Schaefer (call ?) will remain to babysit the S/C until launch.

The AMSAT Launch Information Network Service (ALINS) is shaping up very nicely under the leadership of W0RPK. ALINS for P3B launch may be the most widely heard amateur radio event ever with stations from England to Hawaii retransmitting the launch day, real-time coverage orginating at Goddard. Target areas for these transmissions cover virtually the entire globe. Pre-launch and post-launch nets are well-staffed too.

All nets prior to P3B launch should heavily stress P3B-related info such as beacon frequencies, recommended station equipment capabilities, where to get more info (ASR, ORBIT, P.O. Boc 27, etc), and especially to NOT use the P3B transponder(s) until officially released for general use.

W3IWI and WA2LQQ will be on travel (both to California but on separate missions) soon. K1HTV will provide daily bulletins via this media to keep all posted. If nothing changes, a "Status Quo" notice will be issued. WA2LQQ will be back o/a 8 Jun. W3IWI ETR late Jun.

Bell's theorm syas that due to weird quantum effects an event can cause
changes in another event via what appears to be faster-then-light messages.
But, due to the random nature of the changes the only way to determine
the what actually happened to to compare the sequence of events at one
place with the sequence of events at the other which need non-random
messages which must travel slower then light. This is the same problem
observed in the famous twin paradox where as long a constant velocities
are maintained the you can never get the twins together to compare there
aging and determine which is really older.

                    Mark Biggar

The following is an updated time line for certain events in the Phase 3-B
mission, starting with Ariane first stage ignition (H0) and ending

with the first motor firing at fourth apogee. The clock time entries are based on a launch at the opening of the window on 16 June; a delay in the launch would of course not affect the elapsed time column.

The "AOS/LOS" times early in the mission are only of academic interest, since the transmitter will most likely be kept off for five hours after launch to allow outgassing to hard vacuum. Times of various events during launch are approximate, as I do not yet have ESA final values for these (most of the entries in the ESA manual say "TBD".)

Elapsed time	Clock time	Event
+00:00:00	Thu Jun 16 11:59:00 1983 UTC	Elapsed time zero (H0)
+00:00:03.4	Thu Jun 16 11:59:03 1983 UTC	Liftoff

UOSAT SPACECRAFT CONTROL CENTRE
UNIVERSITY OF SURREY, GUILDFORD, SURREY, ENGLAND
****

**** UOSAT BULLETIN-27   1200 GMT 3 JUNE 1983 ****

** OSCAR-8 NEWS **

THE AMSAT-OSCAR-8 SPACECRAFT WAS ACTIVATED IN MODE-J ON 2 JUNE FOLLOWING A BATTERY RECHARGE PERIOD. THE TRANSPONDER OPERATED CORRECTLY ON THE FIRST ORBIT WITH AN INITIAL BATTERY TELEMETRY COUNT OF 364. BY THE NEXT ORBIT THE BATTERY COUNT HAD FALLEN TO 329 AND AO-8 WAS SUBSEQUENTLY COMMANDED TO MODE-D (RECHARGE). THE MODE-A TRANSPONDER HAS BEEN ACTIVATED FOR SHORT PERIODS TO GATHER TELEMETRY, BUT AS THE BATTERY COUNT WAS STILL LOW THE SPACECRAFT WILL REMAIN IN MODE-D RECHARGE, EXCEPT FOR SHORT PERIODS WHEN THE MODE-A TRANSPONDER WILL BE ACTIVATED TO GATHER TELEMETRY.

IT IS ESSENTIAL THAT YOU DO NOT USE OSCAR-8 IF YOU SHOULD HEAR IT ON DURING THIS PERIOD

** UOSAT NEWS **

AS REPORTED BY A NUMBER OF CORRESPONDENTS DURING THE WEEK, THE MEMORY ERROR RECOVERY COUNTER BITS IN THE TELEMETRY FRAME COULD BE SEEN COUNTING RAPIDLY WHILE THE BULLETIN WAS RUNNING LAST WEEKEND. THE BULLETIN PROGRAM (WITH A 19 HOUR TIMING LOOP) WAS RE-RUN ON WEDNESDAY 1/6/83, AND THE COUNTING DID NOT RECUR. OUR ANALYSIS OF THE SITUATION IS THAT A SOFT ERROR OCCURRED IN A BYTE WHICH WAS ACCESSED VERY FREQUENTLY BY THE BULLETIN PROGRAM AND THIS WAS HAMMING-CORRECTED EACH TIME IT WAS READ DURING THE WEEKEND. THE NON-RECURRENCE DURING A RERUN OF THE

PROGRAM INDICATES NO PERMANENT MEMORY FAULT. THANKS FOR THE REPORTS ABOUT THIS EVENT.

THE SPACECRAFT REMAINS STABLE IN A FLAT (END OVER END) SPIN WITH A +Y/-Y FACET TEMPERATURE GRADIENT OF AROUND 65C. ANALYSIS OF THE SCIENTIFIC AND NAVIGATION MAGNETOMETER DATA HAS SHOWN THAT THE TIP MASS Z-AXIS IS ORIENTED AT 93 DEGREES TO THE SPACECRAFT Z-AXIS. THE OFFSET BOOM DEPLOYMENT HAS CAUSED THE EFFECTIVE Z-SPIN AXIS TO SHIFT 6 DEGREES FROM THE SPACECRAFT Z-AXIS.

INVESTIGATION OF THE BENT BOOM SITUATION HAS INVOLVED A NUMBER OF DEPLOYMENTS AND RETRACTIONS OF THE BOOM TO ESTIMATE THE CHANGE IN POSITION OF THE TIP MASS. THE EFFECTS OF TWO 25CM EXTENSIONS OF THE BOOM HAVE BEEN MINIMAL, AND A FURTHER DEPLOYMENT OF 50CM WAS PERFORMED ON 02/06/83. THE RESULTS OF THIS ARE STILL BEING ANALYSED, BUT NO CHANGE WILL LEAD TO RETRACTION TESTS BEFORE ABANDONING FURTHER RECOVERY ATTEMPTS.

DETAILS OF THE WHOLE-ORBIT TELEMETRY RECORDING PROGRAM ARE REPEATED BELOW. THIS PROGRAM CAN STORE 7 CHANNELS OF TELEMETRY OVER A PERIOD OF UP TO 100 MINUTES (OR 1 CHANNEL FOR APPROX. 700 MINUTES) FOR LATER TRANSMISSION. PLOTS OF THE TELEMETRY CHANNELS RECORDED BY THE SPACECRAFT THROUGHOUT A WHOLE ORBIT (INCLUDING ECLIPSE, ETC) ARE USEFUL INDICATORS TO THE CONDITION OF THE VARIOUS INTERNAL SYSTEMS. THE PROGRAM PRODUCES CHECKSUMMED LINES OF DATA, WITH SERIAL NUMBERS AND A VARIABLE NUMBER OF TELEMETRY DATA VALUES. EACH LINE HAS BEEN RECORDED FROM THE STANDARD TELEMETRY FRAME (5.28 SECONDS DURATION, EACH CHANNEL DIGITISED AT THE TIME IT WOULD BE TRANSMITTED IN THE STANDARD TELEMETRY FORMAT). THE DOWNLINK FORMAT IS:

NNNNXYZXYZXYZXYZCC

WHERE NNNN IS 4-HEX DIGIT SERIAL NUMBER (UP TO 046DH LINES ARE SENT AS DATA IS ACCUMULATED)

XYZ ARE BCD TELEMETRY CHANNEL VALUES AS IN ORDINARY TELEMETRY

CC IS 1 BYTE CHECKSUM (ADD NN, NN, 0X, YZ, CC BYTES USING 8-BIT BINARY ADDITION - RESULT SHOULD BE 0AAH).

NNNN=0000 GIVES CHANNEL NUMBERS RECORDED IN 0YZ POSITIONS.

THE LINE WITH SERIAL NUMBER 0001 WAS RECORDED AT THE PROGRAM LOAD TIME. NO COMPUTER-READABLE TIMESTAMP IS AVAILABLE, BUT WE WILL ATTEMPT TO GIVE THE PROGRAM LOAD TIME AND TELEMETRY CHANNEL NUMBERS IN FUTURE BULLETINS. DISPLAYING WHOLE-ORBIT DATA IN REAL TIME (OR FROM A TAPE RECORDING) IS AN IDEAL DEMONSTRATION FOR EXHIBITIONS, ETC.

** S/C OPERATIONS SCHEDULE **

FRI 03/6/83 TO MON 06/6/83	1200 TELEMETRY, 1200 BULLETIN, DIGITALKER, 2.4GHZ BEACON
MON 06/6/83 TO FRI 10/6/83	VARIOUS DATA FORMATS (145 & 435

MHZ) TO FURTHER INVESTIGATE THE
BOOM SITUATION.

AN 1802 PROGRAM TO STORE AND RE-TRANSMIT RADIATION COUNTER DATA TOGETHER WITH THE TELEMETRY CHANNELS NECESSARY TO ANALYSE THE SPACECRAFT ATTITUDE HAS BEEN DEVELOPED - TESTING HAS BEEN DELAYED BUT SHOULD BE DONE NEXT WEEK. DOWNLINK FORMAT WILL BE SIMILAR TO THE WHOLE-ORBIT TELEMETRY DATA AND WILL BE DESCRIBED FULLY WHEN TESTING IS COMPLETE

** THANKS FOR REPORTS ** WB8OTH, K1KSY, JA2GSD, B.LINDHOLM, K2AR, K1KSY, ON6UG, KA9Q, F1GRR, G3UMF, JA7IEL, JA7IE

WE WOULD APPRECIATE REPORTS FROM STATIONS ABLE TO DECODE DATA FROM THE 435MHZ AND 2.4GHZ BEACONS - RELIABILITY AND BURST LENGTH AT CURRENT ATTITUDE & SPIN - THIS INFORMATION FOR FUTURE PACKET DEMONSTRATIONS.

*** UOSAT MISSION PLANNING ***

A UOSAT MISSION PLANNING MEETING WAS HELD AT SURREY ON 23/05/83 TO FORMULATE A FORWARD-LOOK FOR THE NEXT THREE MONTH PERIOD OF UOSAT OPERATIONS. THE PLAN REPRESENTS THE OVERALL MISSION DIRECTION RATHER THAN A SPECIFIC OPERATIONS SCHEDULE AND REMAINS FLEXIBLE TO OPERATIONAL EVOLUTION.

* STABILISATION/ATTITUDE CONTROL:

DETAILED ANALYSIS OF SPACECRAFT DATA HAS LOCATED THE POSITION OF THE TIP-MASS AND BOOM FOLLOWING DEPLOYMENT AND SUBSEQUENT CABLE SNAG. ATTEMPTS TO STRAIGHTEN THE BOOM WILL RESUME, BUT IF UNSUCCESSFUL OR WITHOUT SPECIFIC PROMISE AFTER 10/06/83, ATTEMPTS WILL BE TERMINATED AND NO FURTHER SPACECRAFT TIME ALLOCATED TO THIS PROGRAMME. THE BOOM PROBLEM DOES NOT AFFECT THE USER SPACECRAFT OPERATIONS DRAMATICALLY AND THE FINITE SPACECRAFT RESOURCES SHOULD BE DIRECTED TO OTHER PROFITABLE EXPERIMENTS NOT YET FULLY EXPLOITED. THE SPACECRAFT CAN BE ALLOWED TO REMAIN IN A NATURAL SPIN STATE WHICH IS QUITE ACCEPTABLE, WHILST THE POSSIBILITIES (& DESIRABILITY) OF CONTROLLED SPIN OR WEAK GRAVITY CAPTURE ARE ASSESSED.

* H.F.BEACONS EXPT:

FOLLOWING THE TERMINATION OF THE STABILISATION PROGRAMME, THE H.F. ANTENNAS WILL BE DEPLOYED AND THE BEACONS ACTIVATED.

* PARTICLE EXPERIMENT:

ADVANCED SOFTWARE HAS BEEN RECENTLY DEVELOPED TO ENHANCE THE

VALUE OF THE EXPERIMENT DATA. WHEN COMMISSIONED, THE NUMBER OF WHOLE ORBIT OBSERVATIONS WILL BE INCREASED.

* 2.4GHZ BEACON:

THE BEACON HAS BEEN ACTIVATED RECENTLY AND SUCCESSFULLY RECEIVED IN THE UK AND BELGIUM. THIS BEACON CARRIES THE SAME DATA AS THE 145MHZ DOWNLINK, AND WILL BE ACTIVATED ROUTINELY AT WEEKENDS, POWER BUDGET PERMITTING, AND FOR OTHER SPECIFIC EXPERIMENTS.

* CCD CAMERA & VIDEO EXPT:

THE OPERATIONAL IMPLICATIONS OF CLOSING THE LINK BETWEEN THE 1802 COMPUTER AND THE VIDEO DISPLAY EXPT. WILL BE ANALYSED IN DETAIL WITH A VIEW TO POSSIBLE IMAGE PROCESSING OF THE CCD DATA AND, PARTICULARLY, UP-LOADING IMAGES AND GRAPHICS FROM THE GROUND. (IN ADDITION, THIS LINK PROVIDES ACCESS TO A FURTHER 32K OF MEMORY FOR THE 1802 FOR USE IN DATA COLLECTION AND BULLETINS ETC.)

THIS ACTIVITY IS HIGHLY DESIRABLE TO STIMULATE INTEREST IN THE CCD & VIDEO EXPERIMENTS AND TO EVALUATE THE SYSTEM FOR FUTURE SPACECRAFT EXPERIMENTS.

* DIGITALKER:

THE DIGITALKER EXPT. HAS BEEN HIGHLY SUCCESSFUL AND GENERATED A GREAT DEAL OF INTEREST WHILST, AT TIMES, PROVING OPERATIONALLY VALUABLE. EFFORTS WILL BE MADE TO EXPAND THE SCOPE OF THIS EXPT.

* SCIENTIFIC MAGNETOMETER:

THIS INSTRUMENT HAS, THUS FAR, BEEN UTILISED PRIMARILY FOR SPACECRAFT NAVIGATION HOWEVER IT IS PROPOSED TO DEVELOP SOFTWARE TO ALLOW THE STUDY OF THE SHORT-TERM, LOW-LEVEL PERTURBATIONS TO THE GEOMAGNETIC FIELD AND THEIR RELATIONSHIP TO RADIOWAVE PROPAGATION PHENOMENA.

* DIGITAL PACKET RADIO COMMUNICATIONS:

IN PREPARATION FOR THE PROPOSED PACSAT SPACECRAFT, PACKET RADIO EXPERIMENTS SHOULD BE INITIATED BETWEEN UOS AND AMSAT-USA DEVELOPING FURTHER THE EXISTING PACKET COMMUNICATIONS USED IN THE CONTROL AND DATA TRANSFER ON UOSAT.

Official AMSAT P3B Bulletin #004
0530 UTC 05 June 83

TO:QST
FM:AMSAT HQ
RLSD:K1HTV

The AMSAT Phase III-B launch support team from the U.S.A. ,
Dick Daniels, W4PUJ and Jan King, W3GEY arrived home safely
from Kourou, French Guiana saturday afternoon. Gordon Hardman,
ZS1FE left the site Thursday for his South African QTH while
part of the German-DL crew including Karl Meinzer,DJ4ZC, Werner
Haas,DJ5KQ and Wolfgang Mueller (no call) of MBB will leave for

Germany on monday, June the 6th. Staying with the spacecraft at the launch site will be Ulrich Mueller,DK4VW and Connie Mueller (no call). They will be joined later by another AMSAT-DL crew member Wolfgang Schaefer, who first will pass through the Washington area on his way to Kourou.

The AMSAT Phase III-B spacecraft , now enclosed in the Sylda, and the European Communications Satellite, ECS-1 will be mated to the Ariane launcher monday June 6th. On that day ESA should make the decision if the earlier announced June 16 launch is a viable one.

This is a launch event sequence for Ariane 6, carrying AMSAT Phase 3-B and ECS-1. All times are nominal and are in seconds relative to H0 (first stage ignition.)

-9   Inertial guidance platform uncaging
-4   Third stage cryo arm unlock
-.2 Third stage cryo arms retract
0   First stage ignition
+3.4   Liftoff (release launch table jaws)
13   10 sec roll to orient Y axis for correct launch azimuth
23   End of vertical ascent; start 1.8 deg/sec yaw towards initial launch azimuth of 78 deg from north
145.6   First stage tailoff - half thrust; ascent angle at 45 deg
148 Ignition 2nd stage ullage rockets
150.48   Stage 1/2 separation, ignition 1st stage retro rockets
150.5   Telemetry format change
151.25   Second stage ignition
153.7   Second stage up to nominal thrust
158.0   Second stage ullage rocket jettison
160.6   Guidance start; flight azimuth dogleg from 78 deg to 105.5 deg at 2 deg/sec
254 Fairing jettison
286.9   Second stage tailoff - half thrust

287.7   Ignition 3rd stage ullage rockets
291.85   Stage 2/3 separation, ignition 2nd stage retro rockets
296.9   Third stage up to nominal thrust
297.2   Second stage retro rocket burnout
307.7   Third stage ullage rocket jettison
854 Third stage shutdown sequence start
856.4   Attitude reorientation for ECS-1
918.4   10 RPM spinup start
939.4   End of spinup; ECS-1 separation
941.4   Sylda upper structure separation
945.4   Despin start
964.4   Roll angle at 90 deg
983.4   Attitude orientation for AMSAT Phase 3-B
1015.4   End of attitude reorientation; start 10 RPM spinup
1040.4   End of spinup; AMSAT Phase 3-B separation & powerup
1043.4   Despin start
1071.0   Roll angle at 0 deg
1095.9   Pitch angle at 90 deg
1144.9   Start spin 18 deg/sec

The last maneuver is to start the spent third stage tumbling, so
as to make it re-enter more quickly.

As you can see, a LOT happens in just a few minutes! I have not
listed several roll maneuvers intended to keep ground tracking
stations out of launcher telemetry antenna nulls.

Preliminary documentation and firmware are available for a stand-alone
Z80 AMTOR system. The "Z-AMTOR" system operates with a home-brew
(no PC yet available) 4 MHz Z80 system and works with Baudot terminals
at 45, 50, and 74 bps as well as ASCII terminals at 110 and 300 bps.

This system runs modes A, B, S (selective B) and L (monitor mode A communicaitons). It is, if I say so myself, one of the best implementations of AMTOR available. It has been in the programming stage for over a year.

Anyone SERIOUSLY interested in building such a system is invited to send a $0.71, 9" x 12" SASE and a 250 nS 2764 EPROM to:

Paul Newland, ad7i
POB 205
Holmdel, NJ 07733

I will forward a copy of the documentation and program your EPROM. Be sure the stamps are glued onto the envelope. Don't send money, I'll just pocket it and claim I never got your letter! NOTE: don't send an SASE without an EPROM. If you do, I'll return your envelope without stuffing it. If you don't send an EPROM you probably are not serious about building a system. I am looking for people to help me test the code, not increase my xeroxing costs!

If you are not totally passionate about AMTOR but would like to get the documentation, way till later this year; it will appear in one of the major ham mags.

73, ad7i

Official AMSAT P3B Bulletin #005
0300 UTC 7 June 83

TO: QST
FM: AMSAT HQ
RLSD: K1HTV

A spokesperson from the Washington offices of the European Space Agency said that a Telex received from their Paris

headquarters on Monday June 6th indicated that the Ariane LO6 launch campaign continues on schedule. The main payload, ECS-1, is scheduled to be put in place on top the Sylda, in which the AMSAT Phase 3-B spacecraft is now enclosed.

Testing of the European Communications Satellite will take place at the Kourou launch site this Wednesday followed by the assembling of the ferring on Thursday the 9th of June. Next comes the turpo pump lubrication procedure followed by the calibration of the inertial guidance system on Saturday.

If all goes well, there will be a launch rehearsal Monday June 13. The launch readiness review and the arming of the launcher paylaod are both planned for Tuesday the 14th. The countdown procedure will begin on the 15th, with liftoff of the ECS-1 and Phase III-B spacecraft now scheduled for 11:59 UTC on Thursday June the sixteenth (16th).

The following is a message from Bernie Glassmeyer, W9KDR, at ARRL Headquarters. Amsat-Oscar-8, which has been operated by the ARRL since its launch over 5 years ago, has just recently developed serious battery trouble (it probably knows it is about to be replaced!)

DO NOT ATTEMPT COMMUNICATION THROUGH THE OSCAR 8 TRANSPONDERS DURING THIS LOW VOLTAGE EMERGENCY. PRESENTLY OSCAR 8 IS IN MODE A AND COMMAND STATIONS HAVE BEEN INSTRUCTED TO
RETURN TO MODE D, RECHARGE WHEN TELEMETRY TESTS ARE COMPLETE. TELEMETRY RECEIVED IN MODE A INDICATES THE BATTERY VOLTAGE HAS DROPPED TO A POINT THAT HAS CAUSED THE TELEMETRY TO "HANG UP". THE PRESENT FRAME OF 180 252 324 496 568 696, EVEN AFTER SEVERAL DAYS OF RECHARGE, INDICATES THAT THE BATTERY IS NOT CHARGING. COMMAND STATIONS REQUEST THAT ANYONE MONITORING ANY VARIATION IN THE PRESENT FRAME REPORT THE READINGS TO ARRL HQ.
OBSERVATIONS SO FAR INDICATE THAT OSCAR 8 IS FOLLOWING A SIMILAR BATTERY PROBLEM THAT OSCAR 7 SUFFERED. IT IS QUITE POSSIBLE THAT

ANY FUTURE OPERATION OF OSCAR 8 WILL BE DURING TIMES THAT THE
SPACECRAFT IS IN SUNLIGHT. PRESENTLY WE ARE AT A MINIMUM OF
IN A MINIMUM SUNLIGHT
PERIOD WHICH COMPLICATES MATTERS EVEN MORE. REMEMBER NO OPERATION
UNTIL FURTHER NOTICE. 73 BERNIE W9KDR.

Official AMSAT P3B Bulletin #006
2300 UTC 8 June 83

TO:QST
FM:AMSAT HQ
RLSD:K1HTV

The Washington office of ESA was called today regarding the
upcoming Ariane LO-6 mission and indicated that there was no
change in the earlier released information. The launch of Phase
3-B is still scheduled for 11:59 UTC on Thursday, June 16th
with the launch window extending until 12:28 UTC.

Preparations continue for ALINS, The AMSAT Launch Information
Network System . W4OWA has notified AMSAT that arrangements
have been completed with American Bell for use of their
conference bridge for ALINS. A brief prelaunch test of the
system will be held at 0000 UTC June 16, about 12 hours before
the scheduled liftoff.

Jan King, W3GEY, recently back from the Kourou launch site has
indicated that five minute bulletin transmissions originating
from the 145.81 MHz General Beacon of Phase III-B scheduled for
on the hour and thirty minutes past the hour will only be sent
in CW in the earlier orbits. RTTY will be added at a later
date. It appears now that in order to reduce battery drain
during the early orbits when the solar panels are not yet
properly oriented , the 145.987 MHz Engineering beacon will be
kept off most of the time.

In the early phase of the mission, Phase III-B 2 meter
transmissions will be made on the omni antenna. The effects
noticed during these early orbits are that downlink signals
will appear to be at least 10 DB weaker and that more fading
will be noted on the downlink signals.

More information will follow in the days to come.

Official AMSAT P3B Bulletin #007
2300 UTC 9 Jun 83

TO: QST
FM: AMSAT HQ
RLSD: WA2LQQ

All conditions for launch 16 Jun 83 continue to appear
very favorable.

Preparations withing AMSAT for launch support from the
Engineering, Operations and Public Relations communities
are generally nearing completion and are close to schedule.

A potential risk is possible interruption to Telemail
to the command/tracking teams should the scheduled outage
(15 Jun 0900 - 1100 UTC) slip into the next day. Telemail
will be used to transmit tracking data between command
stations and the compuational facilities interfaced at KA9Q.

ALINS preparations are nearly complete. A brief
test of the conference bridge will be conducted
0000 UTC 16 Jun 83. Check with K1HTV for details
and/or instructions.

Prelaunch bulletins from W2LV, W2BXA and WA6GFY
are scheduled to commence 11 Jun. See schedules
transmitted by RWALLIO, May 30, 1983, 3:48 GMT.

Bulletin text for use by these stations will be
posted to the PR bulletin board with vectors from
the AMSAT BB. Prelaunch bulletin text will comprise
an especially prepared version of the Official
AMSAT bulletin summarizing the launch progress/
status for the time covered by the bulletin.

Amateur Satellite Report will publish a special
edition shortly after launch. The special ASR
will contain a compilation of info necessary
and (Hopefully) sufficient to get many
novitiates started on P3B. It will be sent to
all regular subscribers and be available to
others on a limited offer basis for $3 ppd
to U.S., Canada, Mex; $4 elsewhere.

To put things in perspective, think of it THIS way:
we are now at T-157 HOURS...and counting!

By WA2LQQ

AMSAT's Phase 3B satellite is now fully prepared for launch.
The satellite is mounted on its Ariane launcher in Kourou, French
Guiana. The launch window is on 16 Jun from 1159 to 1328 UTC. Repeat.
The launch window is Jun 16, 1159 to 1328 UTC.

The AMSAT Launch Information Network Service will transmit live

reports of the progress of the launch as they occur on launch day. Many stations around the world will carry the audio feed originating at AMSAT's primary command station at the Goddard Space Flight Center in Maryland. Stations carrying the Launch Network include W1AW. W1AW will transmit will relay the audio on all of its normal single sideband frequencies. They are: 1890, 3990, 7290, 14,290, 21,390, 28,590 kHz and 50.190 and 147.555 MHz FM. Additionally, other HF stations will be on 3780, 3850, 7080, 7170, 7180, 7182, 14250, 14260, 14265, 14280, 21265, 21280 and 21285 kHz. Tune to the station you hear best.

Subsequent to launch monitor AMSAT net frequencies including 3850 and 14282 for latest progress reports.

Initial spacecraft testing will commence five hours after launch. First AOS will be in Europe and East Africa when the Mode B beacon is activated exactly five hours after launch. Monitor the Mode B General Beacon on 145.810 MHz. Five minutes of CW and 25 minutes of PSK telemetry will be sent each half hour. Telemetry equations are available in Amateur Satellite Report.

In summary, all is in readiness for the launch of Phase 3B on Jun 16th with the launch window opening at 0800 AM Eastern Daylight Time. The launch net will commence operations beginning approximately one half hour prior to launch.

If all goes well the new OSCAR will be available for general use in 3 to 6 weeks. Announcements will be made. Standby for further news.

The phrase "computer readable" means that a computer can put the
information in question onto one or more of its standard memory
devices with minimal human intervention. The term is really no
longer simply a function of the material that you are trying to
classify as "computer readable" or "non-computer readable".
It is also a function (these days) of the peripherals available
at the site trying to do the reading. If you have the proper
optical scanners and software, newspapers are "computer readable" --
all the operator has to do is turn the pages and set the scanner
at the beginning of the page. On my computer, however, without
the optical scanner, the same document would not be computer
readable -- to get the information into my computer I would have
to type it in by hand. In general these days, magnetic tape and magnetic
discs are considered computer readable. Depending on an individual
site's peripherals, one might selectively include paper tape, laser
discs, audio recording media, cleanly legible printed materials, etc.

Official AMSAT P3B Bulletin #009
1830 UTC 12 Jun 83

TO: QST
FM: AMSAT HQ
RLSD: WA2LQQ

All conditions for launch as planned 16 June appear excellent.

So reports F8ZS from FY7KRU at the launch facility in Kourou.
Jon reports that all problems with the turbopump lubrication
and the inertial platform have been overcome.

A preflight review meeting will be held Tuesday. If no new
problems are uncovered the countdown will begin Wednesday.

The preparations are one full day ahead of schedule now so the
several launch crews are taking the day off from work.

Some additional work remains to be done in connection with the
interface between the blockhouse and the station FY7KRU. The
"interfphone" [intercom] line must be finalized and some
problems with TVI from the HF linear used at the station must
be eliminated, Jon said.

In another domain, KA9Q relates that first AOS may occur for
ZS1FE as soon as T+2:30; a full two and one half hours
earlier than previously reported (cf PreLaunch #001, 002).
The correct time, Phil points out, should be corroborated
by W3GEY who was out of town as this bulletin was composed.
Further detail on this as it becomes available.
[This time refers to when the general beacon will be first commanded
on; it is my understanding that this will be done in time for
AOS at ZS1FE in South Africa at T + 2hours 30 minutes - KA9Q]

Most cordless phones fall into one of two categories:

o+ Base to handset frequencies between 1700 and 1850 kHz.
Handset to base frequency in VHF region.

o+ Base to handset and handset to base frequencies both in
VHF region.

The VHF frequencies used by cordless phones are:

49.83 mHz.
49.845
49.86
49.875
49.89

These VHF frequencies are shared by other devices, such as:

o+ low power walkie-talkies (Radio Shack's Archer Space
Patrol (TM), Sony's Talkman (TM)

o+ wireless microphones (Radio Shack's Realistic 32-1220
and 33-1076)

o+ radio controlled toys

Owners of scanners or general coverage short wave receivers
may listen in on these phone conversations, so privacy is
not assured.

These cordless phones use frequency modulated emission.
I
don't recall the lower frequency channels. The owners of
these cordless phones must accept any interference they
may
receive and must correct any interference they may cause. A
label to this effect must be attached to newer cordless
phones.

Other frequencies may be allocated for this use in the future by the FCC. For more information, refer to the June 1983 issue of Popular Communications magazine (Cowan Publishing).

QST de ad7i

Sorry folks, but I will have to discontinue bulletin service
for the net. My station will be going AMTOR ONLY in a week
or so. I have tried to get the ARRL to send bulletins on W1AW
using AMTOR but I have not had much luck. They seem interested
but perhaps I am the only one who wants to have them send
AMTOR stuff.

This being summer time, I am now having enough ++hits++ in the copy
here in jersey to render the BAUDOT and ASCII bulletins unusable.
I don't know what it will take to get the League moving, but if
you would like to see consistent posting of ARRL bulletins to the net,
you might send HQ in Newington (and/or your director) a card
asking them (NICELY -- don't make a big deal of it) when W1AW will
broadcast AMTOR bulletins on a regularly scheduled basis. You
don't need to mention me (they are probably so tired of hearing
from me on this issue!), just ask the question. If the general
membership makes the request, rather than just one individual,

perhaps that will prompt them to get things moving.

A N N O U N C E M E N T

TNC AVAILABILITY

Tucson Amateur Packet Radio Corporation has conducted extensive testing of a Terminal Node Controller (TNC) design over the last several months. 172 TAPR TNCs are in the field, and the "Beta" design has been in continuous testing since early November, 1982.

In order to more fully discharge our charter in developing and refining packet radio communications, TAPR is on the brink of releasing the TAPR TNC to the general Amateur community. The TNC will be provided as a kit that includes all parts; comprehensive manual including detailed kit assembly instructions; custom power transformer with multitap primary for those in low- or high-voltage areas; electrically pre-tested printed circuit board with silk screened parts locations; built-in modem, power supply, RS232 interface and radio interface.

REFINED DESIGN

For those familiar with the Beta design, the following

improvements have been implemented in the hardware design:

1) 32 k bytes of EPROM (vs Beta's 24 k).

2) 8k bytes of RAM (vs Beta's 6 k).

3) Two 512-bit banks of NOVRAM (vs Beta's single 256-bits).

4) Modem disconnect, with all applicable HDLC connections.

5) Improved modem design, with lower noise floor, greater input signal range, greater mic audio adjustment range, improved signal level indicator circuitry, LED monitoring of additional signal lines (such as Data Carrier Detect), configuration of modem parameters via DIP carrier.

6) Serial I/O port access is via a right angle pc mount DB25S connector at the edge of the board.

7) Parallel port access is via a right angle pc mount DB25P connecter at the edge of the board.

8) Radio I/O port access is via a right angle pc mount DB9S connector at the

---

edge of the board.

9) Power connection is via an 8-pin "Molex" style power connector.

10) The +5 volt supply uses 3 amp diodes instead of the 1N4001s found on the Beta board.

11) The +5 volt supply has a jumper, along with additional power supply

connector pins, to support an off-board 5 volt regulator.

12) The power transformer has been redesigned with 105/115/125 volt ac primary taps and corrected secondary windings.

13) The serial I/O port uses pullup resistors so no jumpers are needed to support partial RS232 interfaces (such as "three-wire" terminals).

14) Revised circuitry for calibrating the 1700 Hz PLL demodulator.

TAPR is currently generating the updated manual and the board layout is being revised. At the conclusion of board layout, a trial run of 25 kits will be supplied to a limited number of Beta sites for testing. This is anticipated in the late-July to mid-August time frame. We are limiting this initial release to a few boards per selected existing site to ensure a rapid turnaround in the testing. It is not our intent during this initial test to bring more sites up. Once we have determined that the revised design is working properly and the documentation is adequate for a reasonably adept Amateur to properly assemble, calibrate, interface and place the TNC into operation, the kits will be made available to all on a more-or-less first-come, first-served basis.

DISTRIBUTION, SCHEDULING and COST

The mechanism for distribution is simple. The orders will be handled based on the order in which they are received. TAPR members will have a degree of priority. Orders for multiple units will be spaced out somewhat so no one can order a huge block and tie up distribution.

How do you get on the list? Send your order to:

Tucson Amateur Packet Radio Corporation
PO Box 22888
Tucson AZ 85734-2888

---

and include your name, shipping address, etc., along with a deposit of $25. Upon receipt of your deposit (including 16 days for clearing of non-cashier's checks), you will be placed in the queue. You will be advised by return mail of your expected shipping date. Balance of payment is due at least one week before scheduled ship date (or you may get bumped!).

TAPR will attempt to have a daytime telephone number where Visa/MasterCard orders can be placed (with an approximate 3% adder for such orders).

The price of the complete kit is $240 plus $7 shipping and handling. This is $29 more than the Beta boards, and the increase is for the following reasons:

1) There is more memory on the board.

2) We are having the pc boards electrically tested.

3) There is a 30 days-after-shipment warranty on the parts (and we have to make this good, not the chip manufacturer).

4) We lost thousands of dollars on Beta.

5) We need money to launch our R & D effort for high-speed UHF linking systems.

6) We are having a commercial firm do the kitting for us to conserve our time for technical work.

Since many of the parts on the TNC are now on allocation, we have taken the steps to schedule a number of kits. However, we need IMMEDIATE feedback on your expected needs, as well as deposits, so we can better plan. Our present schedule calls for general kit deliveries starting in late August/early September. We are planning on 25 kits the first month, followed by 50 kits for each of the following three months. That is only 175 kits, so if you are interested, act promptly! If we get sufficient orders, we will modify the schedule to take care of things as expeditiously as possible.

PRODUCT SUPPORT

Please note that support of the TNC, including such things as service bulletins, modifications for improved performance, announcements of software and hardware updates, etc., will be done via the Packet Status Register, TAPR's official newsletter. Thus, it is suggested that purchasers of the TNC consider becoming members of TAPR.

Thank you for your interest...

Lyle Johnson, WA7GXD
President - TAPR

qst de ad7i
hr propagation forecast bulletin nr 24 from arrl headquarters
newington ct june 13, 1983
to all radio amateurs bt

the solar flux rose to its high for the year, 174 on june 7. since
then it has been falling steadily and was down to 131 on the 12th.
it may drop further, but an upturn is expected soon. present solar
indications are that this will be a major rise.

geomagnetic activity was fair last week, making for mostly below

normal propagation. geomagnetic indices are expected to be lower, and propagation mostly better, june 15 through 17. conditions for the higher latitudes will be fair to poor june 18 through 21. june 22 through 30 will be fair to good, but propagation on all frequencies will be modified frequently by intense sporadic ionization in the e region.

precise prediction of sporadic e is not practical as yet, but its major season is centered on the longest day of the year. it brings short skip on 28 and 50 mhz very frequently in early summer and there is some chance of its happening on 144 mhz as well, at distances of 1000 to 1400 miles.

american sunspot numbers for june 2 through 8 were between 66 and 127 with a mean of 95.0 ar

hr arrl bulletin nr 42 from arrl headquarters
newington ct june 8, 1983
to all radio amateurs bt

amsat oscar 8 is in an emergency low voltage battery condition and the transponders are not to be used. the satellite battery has not been able to hold a charge after several days of recharge. the satellite is in mode a and the telemetry is hung up with readings of 180 252 324 496 568 696. if anyone reads any other variation, please contact arrl hq. observations so far indicate that oscar 8 is following the same battery failure pattern as oscar 7. if this present condition continues the satellite will only be heard when it is in sunlight. oscar 8 is in a minimum sunlight period at the present time but it is expected to gradually increase its exposure so that the battery charging time will be increased. any status change will be announced on w1aw ar

hr arrl bulletin nr 43 from arrl headquarters
newington ct june 13, 1983
to all radio amateurs bt

amsats phase 3b satellite is now fully prepared for launch. the
launch is scheduled for thursday, june 16, with the launch window
from 1159 to 1328 utc. the amsat launch information network will
transmit live reports of the launch, with many stations around the
world relaying the audio originating at the amsat command facility in
maryland. in addition to w1aw on its regular voice frequencies,
other stations will be on 3780, 3850, 7080, 7170, 7180, 7182, 14250,
14260, 14265, 14280, 21265, 21280 and 21285 khz. launch net
operations will begin about 1130 utc.

spacecraft testing will begin shortly after launch. the mode b
beacon will be on 145.810 mhz with 5 minutes of cw and 25 minutes of
psk telemetry each half hour. the new oscar should be available for
general use between 3 and 6 weeks after launch. check the amsat nets
and w1aw for information ar

Official AMSAT P3B Bulletin #010
0300 UTC 14 Jun 83

TO: QST
FM: AMSAT HQ
RLSD: WA2LQQ

All is well. The mission continues to be scheduled
for launch between 1159 and 1328 UTC on the 16th.

No anomalous conditions are known to exist that
could conceiveably affect the launch.

A preflight review will be held today, Tuesday.
If all is well, the countdown to launch will
commence Wednesday.

Now we're really getting close!

I probably should have posted this to net.jokes, but I thought
it would be appreciated more here. It was passed around at one
of the local club's antenna parties recently and I couldn't resist
typing it in. I am not sure of its origin, but it is many photo-
copy generations old.

Antenna Raising Incident

I'm writing in response to your request for additional information for block number 3 of the Accident Report Form. I put "poor planning" as the cause of my accident. You said in your letter that I should explain in more detail. I trust that the following will be sufficient.

I am an Amateur Radio Operator and on the day of the accident I was working alone on the top section of my new 80' tower. When I had completed my work I discovered that I had, over the course of several trips up the tower, brought up about 300 pounds of tools and hardware. Rather than carry the now un-needed tools and materials down by hand, I decided to lower the items down in a small barrel by using a pulley, which fortunately was attached to the gin pole at the top of the tower.

Securing the rope at ground level, I went to the top of the tower and loaded the tools and hardware into the barrel. I went back to the ground and untied the rope holding it tightly to insure a slow descent of the 300 lbs of tools. You will note in block number 11 of the Accident Report Form that I weigh only 155 lbs.

Due to my surprise at being jerked off the ground so suddenly, I lost my presence of mind and forgot to let go of the rope. Needless to say, I proceeded at a rather rapid rate of speed up the side of the tower. In the vicinity of the 40' level, I met the barrel comming down. This explains my fractured skull and collarbone. Slowed only slightly, I continued my rapid ascent, not stopping until the fingers of my right hand were two knuckles deep into the pulley.

Fortunately, by this time, I had regained my presence of mind and was able to hold on to the rope in spite of the pain. At approximately the same time however, the barrel of tools hit the ground and the bottom fell out of the barrel. Devoid of the weight of the tools, the barrel now weighed 20 lbs. I refer you again to my weight in block number 11. As you might imagine, I began a rapid descent down the side of the tower. In the vicinity of the 40' level I met the barrel comming up. This accounts for my two fractured ankles and the lacerations on my legs and lower body.

The encounter with the barrel slowed me enough to lessen my injuries when I fell on the pile of tools, and fortunately only 3 vertebra were cracked. I'm sorry to report however, that as I lay there on the tools, in extreme pain, unable to stand, and watching the empty barrel 80' above me, I again lost my presence of mind. I let go of the rope.

0300 UTC 15 Jun 83

TO: QST
FROM: AMSAT HQ
RLSD:WA2LQQ/3

Conditions for launch as scheduled 16 JUN 83 continue to
be excellent. No known anomalies exist.

The launch window is 1159 thru 1328 UTC on Thursday, 16 Jun.

First AOS is expected to be at about T + 2.5 hrs at JA, ZL and
ZS. First AOS over US will be at about T + 11:00 on
145.810 MHz.

Special commemorative certificates (or QSLs) will be issued
to all stations which report reception of any PreLaunch,
Launch Day or Post Launch ALINS transmission. Simply
report station heard (callsign) time and frequency. Send
with an SASE (SAE with 3 IRCs for overseas QTHs) to:
  ALINS Award, AMSAT HQ, P.O. Box 27, Washington, D.C., 20044
Please pass the word widely on this so we can generate as many
leads for new members as possible as soon as possible. The
addresses on the SASEs will be entered in a data base and all
respondents will receive an AMSAT membership application along
with their certificate (card).

A test of the ALINS network will be accomplished at 0000 UTC
on 16 Jun 83. This is Wednesday evening local time (US).
All ALINS participants are urged to phone in. If you are an
ALINS station and do not yet have the number, you should call
W0RPK NOW!!

If propagation conditions prevent access to ALINS on launch

day, please feel free to call AMSAT HQ for a brief update on
the progress of the launch. The number is: 301-589-6062

Reports of telemetry beacon reception should be coming shortly from
Japan. NORAD deep space radar has seen two objects so far; there are a
total of 5 pieces (the two payloads, the rocket body, the upper half
of the SYLDA cannister, and the clamp band that held Oscar-10 to the
launcher). It is not clear which objects they've seen, but we had expected
that they'd have trouble seeing us at such a distance (we're too small.)

First AOS over the northeastern USA will be at 23:11 UTC this evening,
coming from the southwest. It will be up until about 09:00 UTC. The
general beacon should be on, with a frequency of 145.81 mhz. Reception
reports would be appreciated.

NORAD radar and optical tracking of the Ariane L-6 launch from sites in
Korea and Kwajalein Island has produced two sets of elements. They
apparently see the rocket body and either ECS-1 by itself, or ECS-1 in a
"clump" with the other pieces. They give the following elements for the
"clump". Note that these disagree slightly with the earlier elements,
which were obtained by launcher transponder ranging from Ascension
Island at third stage shutdown. I would continue to use those earlier
(NASA/Goddard) elements, but these may be of interest.

A report from Karl indicates that we have a serious problem with the attitude of the spacecraft. Apparently, our spin axis is very near the sun, which has created a spacecraft emergency. The sun angle is beyond the range of the sun sensor, but is estimated to be ~+70 from the solar array current, +Z axis sensor, and the 40C temperature gradient between the top and bottom of the spacecraft. Karl reports that we have a breakeven or slightly negative power budget with the GB on, a NEGATIVE budget with the EB on, and positive budget with both beacons off. We are therefore going to be keeping the GB off most of the time except for short intervals to check telemetry. Battery charging current is currently 540 ma; load with beacons off approximately 235 ma.

It is not yet known why the attitude is so far off (nearly 90 deg from where it was supposed to be put by the launcher); we have also ruled out the possibility of the launcher having put us in the same attitude as ECS-1. We are currently brainstorming ways around this problem, and hope to have a corrective strategy soon. Since the spin axis is so close to the sun, almost any direction you move it should be an improvement. It therefore might be possible to command the spacecraft to reorient "blind" to improve the sun angle, with the computer monitoring the array current to halt the maneuver if it gets worse.

We'll keep you advised. The beacons will be kept off for long periods of time to aid in battery charging, so don't be alarmed if you don't hear it.

Phil Karn, KA9Q/1

Here's a new element set via Millstone Hill. I now tend to believe
these elements, as they predicted an AOS here 6 minutes earlier than the
Goddard set. We did indeed get AOS earlier.

Satellite: oscar-10
Catalog number: 0
Epoch time: 83168.05000000
   Fri Jun 17 01:12:00 1983 UTC
Element set: 1
Inclination: 8.6080 deg
RA of node: 249.1370 deg
Eccentricity: 0.7290751
Arg of perigee: 178.3420 deg
Mean anomaly: 86.8220 deg
Mean motion: 2.29579060 rev/day
Decay rate: 0.0023431 rev/day^2

```
Epoch rev:               2
Semi major axis: 24277.706 km
Anom period:    627.234905 min
Apogee:          35599.832 km
Perigee:           199.290 km
Beacon:           145.8100 mhz
```

If anyone knows which catalog # and international designator have been assigned, I'd like to know (for convenience only.)

Phil

to all radio amateurs bt

effective immediately, the fcc has eliminated the requirement that amatzurs keep logs of routine operating activities. repeater station trustees no longer need to tape record autopatch and other third party messages. amateurs may, if they desire, continue to keep voluntary logs, and fcc engineers in charge may still mandate log keeping in specific cases. details of non routine operations, such as repeater data when certain power limits are exceeded, auxiliary and remote control operations, and names and call signs of guest control operators are still required to be kept as part of the station records ar

hr arrl bulletin nr 48 from arrl headquarters
newington ct june 16, 1983
to all radio amateurs bt

amsat phase 3b was successfully launched at 1159 utc on june 16. its
general beacon will transmit on about 145.812 mhz on cw or 170 hz
shift 50 baud fsk. the spacecraft achieved an unfavorable attitude,
and the control motors will not be fired tomorrow. the beacon can
only be heard from 0000 to 0020 utc and will be turned off the
remainder of the day to conserve power. users are requested to
retain telemetry data for use on amsat nets. minimum sa readings
should be 20. the approximate format during early orbits follows.

hi hi amsat oscar 10 at xx.xx.xx utc

orbit xxx ma xxx/256 ubat xx.x volts

tbatt xx.x c iarray x.x a sa xx dg spin xx rpm

satellite status first motor firing and orbit change expected during
orbit 3

transponder is off until about orbit 10

listen daily to this bulletin for latest operating news at the hours
and plus 30

amsat oscar 10 hi hi

time will be in hours, minutes and seconds as calculated by the
onboard computer. orbit number will change at perigee. ma is mean
anomaly with 0 being perigee and 128 being apogee. ubat is primary
battery voltage. tbatt is battery temperature in degrees celsius.
iarray is solar array current in amperes. sa is sun angle reference
to spacecraft z axis. spin is spin rate of the spacecraft about its
spin axis in revolutions per minute. listen for fiveiminutes on the
hour and half hour. this format may vary slightlzlm

stations hearing the first telemetry signals from the new amsat oscar
10 satellite were zl1aox, jh4pbq, ja5xpn, ja7ie, jr4brs, jr1swb and
ja8dxb. this occurred between 1444 and 1445 utc 16 june 83 ar

The above were all done using tlm ver 1.5 (830606-1) as I had just
received the latest info. The signal popped up out of the noise
at 14.45 UTC and was heard by ZL3MG in CHRISTCHRCH at the same
time and by other ZL's. The signal was very weak and faded into
the noise at times so some of the tlm data should be read with
caution. I will send the last frame separetly as it is a hex dump.
The above was typed in by hand at 4am local time so there may be
some operator errors too.!!!
Looks like a "good bird" to me.
VY best wishes from all in ZL.  73 Ian ZL1AOX.

Subj:   Let's congratulate ourselves!

Thanks to all for your support over the past three years.
Today's success meant a lot to me personally, as I know it did
to the others who have have spent a lot of long hours to bring
"Phoenix from the ashes".

The messages of congratulations were most appreciated, but you
really should be congratulating yourselves -- it was you who
did it.

AMSAT had to mortgage its future in order to make Phase-3
```

"happen" today. We still have a lot of hard work to make the spacecraft operational.

But we also have a lot of hard work in front of us in order to capitalize on our successes if we want more spacecraft to happen -- Prosthelize the masses of amateur radio in order to get them into the fold as dues-paying members and donors.

If you need any help on preparing programs for meetings and conventions, PLEASE contact Bill Lazarro at AMSAT HQ for support.

Again -- thanks for all the help and lets keep the momentum going full-bore.

Subj: New elements

Here's a new element set via Millstone Hill. I now tend to believe these elements, as they predicted an AOS here 6 minutes earlier than the Goddard set. We did indeed get AOS earlier.

```
Satellite: oscar-10
Catalog number: 0
Epoch time:      83168.05000000
   Fri Jun 17 01:12:00 1983 UTC
Element set:             1
Inclination:        8.6080 deg
RA of node:       249.1370 deg
Eccentricity:    0.7290751
Arg of perigee:   178.3420 deg
Mean anomaly:      86.8220 deg
Mean motion:    2.29579060 rev/day
Decay rate:      0.0023431 rev/day^2
Epoch rev:               2
Semi major axis: 24277.706 km
Anom period:    627.234905 min
Apogee:          35599.832 km
Perigee:           199.290 km
Beacon:           145.8100 mhz
```

If anyone knows which catalog # and international designator have been assigned, I'd like to know (for convenience only.)

Phil

Subj: tracking error

Phil,

Here in the midwest we are noting a potential significant tracking
error using the current set of Keplerian elements. This error is
noted with AMS-81, W3IWI and HP-41 systems all of which generate
very similar tracking data.

We noted AOS at 2259-2300 (exact time not noticed in the excitement
and due to the fact we thought we still were 7-minutes away from
AOS) while all three systems predicted 2307. If this was a true
AOS then there is a 7-minute error. If the beacon had already been
commanded into the 20-on 40-off mode then what we heard was the
beacon firing-up and actual AOS was even earlier.

Would all of the above indicate the Keplerian elements are suspect?
Thanks for your part in today's fantastic events!! 73, Ralph

I would be very interested in finding out the information necessary to make a contact with the astronaut/ham on the next orbiter flight. Would some one please post the times, areas covered, protocol, and callsigns necessary to do this??? I would very much like to make a contact with the orbiter during this flight. Maybe make a date with Ms. Ride......

How about shuttle audio rebroadcasts on hf or 2m. Any one know about that (2m in Portland area)?

Congrats on the sucessful Phase 3B launch!!!

73`s and tnx

Subject: Oscar-10 Status Summary
Message-ID: <1011@eagle.UUCP>
Date: Sat, 18-Jun-83 13:41:35 EDT
Article-I.D.: eagle.1011
Posted: Sat Jun 18 13:41:35 1983
Date-Received: Sun, 19-Jun-83 02:09:26 EDT
Lines: 124

Here is a summary status report from Jan King, W3GEY, Phase 3-B project manager, along with Phil Karn, KA9Q and John DuBois, W1HDX, who are at the primary US command station for Amsat-Oscar-10.

On the first pass visible from the European command station in Marburg (orbit #1), Karl Meinzer, DJ4ZC, determined for the first time that we had the bad sun angle problem. At that time, solar array current was about 100 ma; Karl increased it to approximately 280 ma by adjusting the operating point of the solar arrays. At that time, there were already many pieces of information all indicating that the antenna side of the spacecraft was pointing very near the sun: the low solar array current,

the large temperature gradient between the top and bottom surfaces, the +Z axis sensor reading very high, and no sun pulses from the side-arm sun sensors, which have a limit of +- 45 degrees.

At all times, the command links have been 100% solid. PSK telemetry quality has been improving due to both a "learning curve" in the various stations equipped to receive this signal, and a change to the high gain antenna which was commanded yesterday during orbit 4 [the spacecraft called this orbit 3 because it numbers from zero].

Due to the high sun angle (estimated to be near 70 degrees), average spacecraft temperatures are running very cold. Various readings at apogee are:

Nitrogen Tetroxide tank: -4C
UDMH tank: -7C (the UDMH tank is nearer the cold bottom)
Top battery: -9C
Bottom battery: -17C
Bottom surface: -29C

During perigee, heating effects due to the albedo (reflectivity) of the earth are being observed. These increase the battery temperature to -4 to -5C with some lag due to thermal inertia.

Total solar array current has increased by about 95 ma between orbits 1 and 4 indicate that the sun angle is improving. We believe that the sun angle is improving due to two favorable effects:

1. The motion of the sun, which is increasing in right ascension (celestial longitude) as the earth moves around the sun.

2. A northward precession of the spacecraft spin axis due to slight drag effects on the spacecraft during perigee passages. Since the spacecraft is rotating clockwise as viewed from the rear, with the kick motor pointing almost straight at the center of the earth at perigee, the east-to-west drag force on the large engine bell results in a net south-to-north precession which increases the declination (celestial latitude) of the spin axis.

These two effects are at approximately right angles to each other, and are estimated to be about 1 to 1.5 degrees per day each. This should result in a net improvement in sun angle of about 1.8 degrees per day, and the increases observed so far in solar array current are consistent with this value.

The memory error counter (the onboard computer has a 16K memory with Hamming error-correction circuitry) is counting approximately 4 errors per orbit, two during each pass through the Van Allen radiation belts. This is less than had been expected. The error correction circuitry is working perfectly and so is the onboard computer.

Signal strength from the GB (power about 2 watts) are now quite good.

The EB (engineering beacon) signal is fantastic, but so is the power drain when it is own. This beacon may be switched on between 10 and 15 minutes past the hour; if you hear the GB suddenly switch off before 20 minutes past the hour, look around for the EB.

The regular fade pattern on the beacon is due to "spin modulation" from the hi-gain antenna. We would like to measure the precise interval between fades as a means of determining if the spin rate is slowly decreasing; we would like to gather readings from other stations to help with this. Simply write down the seconds reading from your clock at each fade null over a one or two minute interval, and then go back and compute the average inter-fade interval. We observed an average of 8.9 seconds during the 6/18 04:00 UT transmission and would like any accurate measurements for transmissions either before or after that time.

At this time, we have still not been able to obtain any indication from ESA as to our separation attitude from the launcher; we DO now know, however, that the ECS-1 spacecraft did receive their correct attitude.

Keep those telemetry reports coming. We've had to take time off to get sleep (!) so numbers during the late night (east coast USA time), as well as for passes not visible over the eastern US, are especially helpful.

Keep your fingers crossed. We're confident that we'll get out of this mess, but it will take time and careful planning.

The best set of orbital elements I have been able to obtain from the Millstone Hill L-band deep space radar site about 10 miles from here are as follows:

```
Satellite: oscar-10
Epoch time:      83168.36000000
   Fri Jun 17 08:38:24 1983 UTC
Inclination:        8.5900 deg
RA of node:       249.1010 deg
Eccentricity:    0.7290171
Arg of perigee:   178.4960 deg
Mean anomaly:     343.1210 deg
Mean motion:    2.29630240 rev/day
Decay rate:         8.1e-06 rev/day^2
Epoch rev:                3
Semi major axis: 24274.330 km
Anom period:    627.095107 min
Apogee:          35592.587 km
Perigee:           199.784 km
```

Millstone has not been able to positively identify the various separate pieces of this launch except for the spent third stage of the Ariane which is now quite some distance away. Therefore, these elements could actually be those for ECS-1, although predictions based on these elements have been pretty accurate. It is now clear that we achieved a lower apogee than had been initially indicated, which is why first AOS over the USA came early on Thursday evening. This also explains why the "mean anomaly" counter in

the telemetry, which counts off regularly-spaced 1/256 period time increments over each orbit, was running "slow". Yesterday evening, this count was commanded to step forward 20 counts, but since the rate has not yet been changed it will continue to "lose time".

73,
Phil Karn, KA9Q/1

I just received some new product literature from Regency Electronics, Inc. (Indianapolis, IN) describing their new scanner product line. Some new scanners of interest are:

o+ HX3000 - Handheld 20 channel synthesized scanner that covers 25 mHz through 550 mHz continuously. This includes CB, 10 meters, 220 mHz, military aircraft band (300 mHz range), TV audio, FM broadcast, etc. The modes included are AM, wide band FM, and narrow band FM. A priority channel is included. This scanner uses 5 AA batteries.

o+ HX1000 - Handheld 20 channel synthesized scanner covering 6 bands. This scanner has a priority channel feature and is rated at 2 watts of audio output! The display is LCD. It looks like it's built into a 2

meter handie-talkie case, with a die-cast aluminum frame. It's powered from NiCd batteries and uses a lithium battery for memory retention.

o+ MX7000 - 20 channel base/mobile scanner with coverage from 25 mHz to 1.2 gHz! Modes are AM, wide band FM, and narrow band FM. The display is blue/green vacuum fluorescent. I think the list price for this is about $599.

There were 4 other new scanners announced which were of a more traditional nature. One looks like a table radio. Two new crystal controlled handhelds were also announced.

Apparently, Regency is the only company remaining that manufactures scanners in the USA. Bearcat scanners are now made overseas. Are there any other scanner enthusiasts out there?

Can anyone provide info on active repeaters or other activity on
440 FM in the Monmouth Co. area of NJ. (or the NY Metro area).
Info on nets (NTS, ARES, RACES, etc) would also be appreciated.

Reply by UN*X mail to hogpc!4432jrm, and I will summarize the responses
and post them to the net.

73 and TNX in advance.

Things are definitely looking better up there. It is now believed that a
combination of factors is causing the sun angle to improve at about 3
degrees per day; at this rate, the sun sensor should become operational
only about a week from now. Average temperatures are also improving;
the latest report from Tokyo is that the battery is bottoming out at
about -3.9 C, when it had been considerably colder just a few days ago.

I am doing some research to determine how long we can safely remain in
our current orbit. While I do not yet have access to an analytical
model for solar and lunar perturbations, we can take heart in the fact
that the pieces from previous Ariane launches left in the transfer orbit
are still up there. This even includes Ariane L-1, which was launched
on 24 Dec 1979. The only effect on us will probably be a drop in apogee
height due to perigee drag, which will have a noticeable effect on orbital
period but isn't likely to be serious.

Keep your fingers crossed; the patient is still in guarded condition,
but the trends are all positive.

Phil

** UOSAT HF BEACONS EXPT. **

The UOSAT spacecraft HF antennas release pyros were fired at 02:37 gmt June 21 and the 7,14,21 & 29 MHz beacon activated under on-board computer control. Strong signals were received at UoS on 21.002 MHz with the beacon in alternating morse/carrier transmission mode. The morse speed was switched from 20 wpm to 10 wpm after second 2 minute test.

No signals on 7 & 14 MHz heard - heavy qrm. Signals on 29.510 MHz expected but not received at UoS.

Due to minimal power drain, it is anticipated that the 21 & 28 MHz beacons will be now be left on permanently.

The synthesiser system will be checked out next orbit - 0539 gmt June 21.

Reports of reception of the beacons most useful.

Yes, John, I am afraid that group is serious. I have heard of them before.
I wish that article was satire but am afraid it is not.

That sounds typical of the type of animal that we have been having on
our repeater lately; a potty mouth that uses every 4 letter word you ever
heard and using a false call sign, and another chap that has set up a
receiver above the citizen's band that repeats what it hears on our input!

Yes, we have been tracking these guys down and have been in contact with the
FCC (it will be interesting to see what the FCC will really do).

Our biggest problem is keeping our guys from talking about it on the air.
These clowns have scanners and have heard chatter about them on other
frequencies, and we don't want to scare them away til we find them.

The AMSAT-OSCAR-10 General Beacon was commanded to transmit
continuosly today. The command apparently was made on orbit 12
and its effects were heard for the first time in the Wash., DC
area shortly after the 22:10 UTC AOS of the 145.810 MHz beacon.
Instead of going silent at 22:20 UTC the GB continued to send
mostly PSK telemetry and CW telemetry / satellite status report
bulletins (0-5 & 30-35 min past hour). A-O-X , for the next
couple of hours was in simultaneous view of all of Africa, most
of South America and Europe as well as the eastern part of the
North America.

CW telemetry copied June 21/22 read as follows:

TIME UTC	MA N/256	UBAT V	TBAT C	IARRAY A	SA DG	SPIN RPM
22:30	126	14.8	N1.7	0.4	0.1	2
23:00	138	14.8	N1.7	0.5	0.1	2
00:00	163	14.8	N1.7	0.4	0.1	2
00:30	175	14.8	N2.3	0.5	0.1	2

Please note that Karl has changed the software per our
request to convert the minus sign from a period (.) to the
letter (N) .

Things continue to improve more rapidly than expected aboard
Amsat-Oscar-10. The sun angle is coming down so rapidly that the sun
sensor pulses are expected back by Friday. Battery temperatures are now
spending much of their time above 0 C. In addition, the combined
effects of spin axis and orbit plane precession appear to be moving the
spin axis toward the orientation it will need for the first motor firing!
Once the sun pulses are back, it will then be possible to command the
onboard computer to do spinup and attitude maneuvers for the first
firing.

The General Beacon is now on full time, since the solar array currents
have come up enough to support it.

Some initial ranging has been done, but not enough to well determine
the orbit yet. We're continuing to use elements provided by NORAD
last week but they seem to be slightly off.

A special software routine was written to dwell on a single solar array
in order to determine the spin rate - approximately 6.2 RPM and apparently
INCREASING by itself.

The current orbit has been analyzed and there is no need to worry over
the short term (1 month) about orbit decay.

In short, we seem to have "pulled a TDRS" (to coin a phrase); the
satellite is surviving like a real cat, always landing on its feet.

Subject: AMSAT-OSCAR-10 Orbital Elements
Message-ID: <1018@eagle.UUCP>
Date: Wed, 22-Jun-83 21:33:50 EDT
Article-I.D.: eagle.1018
Posted: Wed Jun 22 21:33:50 1983
Date-Received: Fri, 24-Jun-83 20:15:05 EDT
Lines: 27

This is the latest element set for what is in all probability
Amsat-Oscar-10. There is very little radar data on this object,
primarily because it is so small. However, it gave a good LOS
prediction time for Tokyo earlier today, so it is probably good for
tracking.

Object 14129 - probably Oscar-10:
Epoch time: 83170.50000000
   Sun Jun 19 12:00:00 1983 UTC
Element set: MH 6-22-83
Inclination: 8.5590 deg
RA of node: 248.1490 deg
Eccentricity: 0.7288272
Arg of perigee: 180.3280 deg
Mean anomaly: 313.5510 deg
Mean motion: 2.29924800 rev/day
Decay rate: 0.001 rev/day^2 (poorly determined, probably too large)
Semi major axis: 24253.381 km
Anom period: 626.291727 min
Apogee: 35551.760 km
Perigee: 198.712 km

One AMSAT command station has done some ranging, but there is not yet
enough data to properly define the orbit.

Phil

Are there any other scanner enthusiasts or short wave listeners in the Northeastern Illinois area who care to exchange information as to frequencies of interest?

USENET seems like a good place to exchange this information.

My first contributions in this endeavor are:

o+ The Drug Enforcement Agency of the U.S. Justice Department has a few repeaters in the Chicago area. The one on 418.9 mHz is used for undercover surveillance operations. It makes for good listening.

o+ If you're into listening on the short wave bands, tune to 11.249 mHz USB to hear Air Force 1 (the president's plane) and Air Force 2 (the vice president's plane).

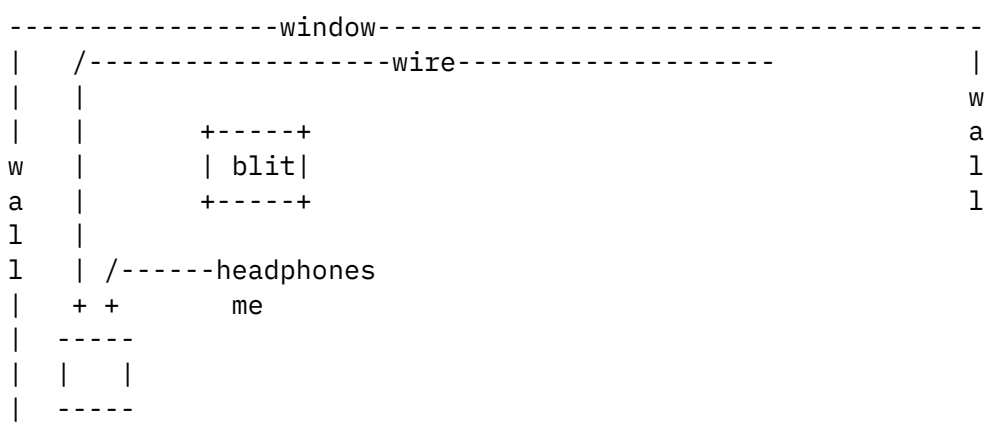
I have a walkman-style radio (specifically, it's a Rhapsody
Stereo-to-go RY-90 with AM-FM-Cassette play/record) I use in
my office, so as not to annoy others around me. Trouble is,
the FM reception is terrible, because (a) the walls are metal
(I do have a window, but the window doesn't open so I can't run
an antenna out it) and (b) the terminal I use, a Blit, puts out
considerable RFI. (Not only does distance from the Blit matter,
but when the screen clears the RFI becomes much less of a problem.
Too bad I can't work with the screen clear.) Cassettes sound fine,
but you get tired of them after a while.

I would appreciate any hints as to how to either shield my radio
or construct an antenna that will bring in good reception. The
unit has two earphone jacks, and apparently the FM antenna is the
headphone cord. I made a brief attempt to make an antenna like this:



|

The wire was wrapped around a stereo mini-plug which was plugged
into the other earphone jack. The reception was considerably worse
with the extra antenna plugged in.

Any hints gladly accepted.

Lines: 63

As a result of WARC 79, the very familiar signals of the emissions modes
will be changed. The FCC will be implementing the following new symbols
over the next several years.

Old Symbol	New Symbol	Old Symbol	New Symbol
A0	N0N	F0	N0N
A1	A1A	F1	F1B
A2	A2A	F2	F2A
	A2D		F2D
A2J	J2A	F3	F3E
	J2D	F4	F3C
A3	A3E	F5	F3F
A3J	J3E	P	P1B
A4	A3C		
A5	C3F		
	A3F		

Symbol Explanation:
  First character indicates emission type
  Second character indicates the nature of the signal
  Third character indicates the type of information transmitted

First Character
  N = Unmodulated carrier
  A = Double sideband AM
  J = Single sideband, suppressed carrier
  F = Frequency modulation
  P = Sequence of unmodulated pulses
  C = Vestigial sidebands

Second Character
  0 = No modulating signal
  1 = Single channel containing digital information without the use
      of a modulating subcarrier
  2 = Same as above, except using a modulating subcarrier
  3 = Single channel containing analog information

Third Character
  N = No information transmitted
  A = Telegraphy -- aural reception
  B = Telegraphy -- automatic reception
  C = Facsimile
  D = Data transmission, telemetry, telecommand
  E = Telephony
  F = Television

Example: A1A is double sideband, single channel containing digital
information without the use of a modulating subcarrier, telegraphy
for aural reception. In other words, CW!

Tnx to Bill, WD9BBI for the above information. Isn't progress wonderful?

73,
John, KA9MNK

In response to my request for interesting frequencies, Bob K9EUI
was kind enough to respond with the following:

Here are a couple spectrum charts and some of the Air Force freqs.
8989 is also a good one for AF-1/2.

Bob, K9EUI

As expected, the sun sensors on AMSAT-OSCAR-10 are now beginning to function. Yesterday, initial data from the sensors indicated that the spin is very low, less than the 2 RPM lower limit at which the spin

rate determination system will function properly. This spin rate was consistent with observed regular fades due to the side lobes of the off-pointed hi-gain antennas.

It was also determined that the spacecraft is apparently spinning slowly BACKWARDS from the direction it should have been spun by the Ariane. This now points to an explanation in which the Ariane either did not give us the correct spin rate or did not spin us up at all.

In any case, software has been loaded to spin up the satellite (in the "backwards" direction so as to avoid going through a zero spin rate) and should execute on the upcoming perigee pass about an hour from now.

Spacecraft systems continue to function quite well, and there is now plenty of power from the solar arrays due to the improved sun angle. Here is a CW telemetry frame just copied from the 145.810 mhz general beacon:

AMSAT OSCAR 10 at 03:30:00 UTC Orbit 19 MA 216/256 TLM: UBAT 14.5 V TBAT 4.9C Iarray 0.4A SA 0.2 dg Spin 2 RPM Satellite status: First motor firing and orbit change delayed to orbit 50 because orientation change required transponder off until then listen to this bulletin on the hour for latest news AMSAT OSCAR 10 HI HI

Comments: Solar array current has not risen because there is already enough current for the spacecraft systems and the battery is fully charged; therefore the battery charge regulator has cut back the operating point of the solar arrays, reducing the generated current. The battery voltage is lower than it was during the first few days of the mission because the NiCds have a negative temperature coefficient; a fully charged battery has a higher open circuit voltage at lower temperatures.

"MA 216/256" (MA = "Mean Anomaly") means that the satellite has completed 216/256 of its orbital period; perigee is defined as MA = 0, and apogee is 128. The SA (sun angle) and Spin figures are still wrong because of the very slow spin rate.

I have just received a report from ZL-land that Oscar-10 has reached a
spin rate of 7 rpm. Magnetic torquing really works!! Next step is
reorientation to motor firing attitude.

Phil

First of all, it won't be the next shuttle flight, it'll be STS-9.
Owen Garriot, W5LFL, will be the operator as he is a mission specialist
for that flight. The orbiter will be Columbia, not Challenger.

This particular flight has another advantage in that the inclination
will be 57 degrees instead of the usual 28.5 degrees. This will
cover northern latitudes much better, but the passes will still be very brief.

The operating protocol will most likely consist of alternate one minute
transmit and receive periods. Owen will scan a range of uplinks on 2
meters (not including his own transmit frequency), record the calls he
hears, and then read them off on his downlink frequency during the
alternate minute.

Read July QST for further details. ARRL & AMSAT will be working jointly
on disseminating info on this project.

Phil Karn, KA9Q

PS. Sally Ride is married. Sorry.

I would like to invite you to comment on contacts you had with leading
manufacturers of ham radio equipment (like ICOM, Kenwood etc.).
I will summarize and post to the net. You might esp. comment on the amount
of time it took to get a response.

You might have contacted a manufacturer for

1. service
2. warranty service
3. technical enquirery
4. proposal for improvement
   etc. etc......

The reason I ask this question is twofold:

1. These are problems which are never discussed in the ham
   radio magazines - may be because of fear to loose advertising
   money.
2. I bought a VB 2530 K (1W/25W 2m amplifier for the TR2500 handeld).
   The BNC cable was missing (it is listed in the manual).
   I wrote to Kenwood telling them that they should send one - for
   free of course. I received a bill for .50.....
   I think it is not my problem that they keep their manual consistent
   with what they intend to deliver.

This past evening, a second spin-up maneuver was performed successfully
on AMSAT-OSCAR-10. The resulting spin rate is now measured as 18.68 RPM,
although the CW telemetry is saying 26 RPM (the CW telemetry routine
has a bad calibration formula in it, but hey, it's only software..!)
The actual measurement was done with a chart recorder attached to the
S-meter of a receiver. If you listen you will hear rapid, regular fading
on the beacon. This is due to the fact that on two meters, the spacecraft
isn't large enough to act as an ideal ground plane for the omni whip,
resulting in three side lobes at certain look angles.

During torquing maneuvers, the general beacon on 145.810 has been placed

into the 20-minute-on, 40-minute-off cycle as a precautionary measure.
Once it is verified that the sun angles are still OK (i.e., the spinup
did the right thing), the beacon will probably be put back on full time
operation.

The next step is a precession of the spin axis northward to the proper
firing attitude. This will probably take a few more days, so that if
all goes well the first motor burn will be next week. Keep your fingers
crossed (or, as the Germans say, hold onto your thumbs!)

Part 97 says we are not allowed to receive remuneration for
services provided by Amateur Radio. This rule is probably
(at least in my opinion) the biggest boon for public service
by amateur radio. A question though: If I originate a message,
does the rule disallow me from offering to pay postage for
the delivering station to mail a copy of the message to
the recipient?

Sorry folks, I received only four replies - so it would be anfair to generalize. Still there seems to be a consensus that

1. It is like dealing with your car dealer - it will take him a minute to sell you a new car but a week to change a broken light bulb.

2. Heathkit (have you read net.audio??) has an extremly good service - which seems to be an exeption.

The next meeting of the Pacific Packet Radio Society will be held:

Monday, July 11th, 8:00 pm
AMPEX Cafeteria
401 Broadway
Redwood City, CA

There will be two topics covered during our July meeting:

1. A report on the first West Coast Linking Committee meeting. This meeting will be held in LA on July 9th, and will hopefully set the ground rules for building a west coast packet network.

2. An update on the current status of AMSAT OSCAR 10. A review of the launch and current plans for the satellite.

See you at the meeting --- 73, Hank KA6M (Phone 415-856-7421).

SCAN Magazine is published bi-monthly by the Scanner Association of North America (SCAN). Mr. Charlie Hildebrandt, of BTL - Holmdel, was kind enough to send me some back issues of this publication.

SCAN Magazine is a glossy, color publication of approximately 30 pages. Aside from feature articles on such topics as Digital Voice Protection, railroad scanning, fire radio terminology, and some technical articles on an elementary level, there are regular columns:

- Frequency Exchange - an ongoing listing of frequency information, sorted by frequency.

- Area Profile - concentrates on one particular geographic area, and contains a rough map and frequency assignments (Buffalo area police frequencies, Chicago area airport frequencies, Pittsburgh fire and EMT frequencies, etc.)

- The World Below 30 mHz - devoted to short wave listening

- Beginner's Advisor - scanning tips for the newcomer

o+ Profile - spotlights particular Community Watch, law enforcement, and ESDA organizations.

o+ Scanning Today - current news briefs of interest to scanner enthusiasts

o+ Photo Contest - photographs of members' "radio shacks"

o+ Member's Ad Service - free classified advertising for members. There's about a page and a half of individual ads for used scanners, crystals, frequency information and other items. Members place ads for such things as "Frequencies and Ten-Codes needed for Champaign County and the Illinois State Police", "Atlanta VHF/UHF aircraft listeners wanted", "Codes and information about Illinois Secretary of State U-car police...", etc. I thought this section was particularly interesting.

The issues I read also featured true stories in which people helped out in crisis situations after overhearing things on their scanners:

o+ Scanner Listener Helps Police Nab Bank Robbers

o+ TV Cameraman "Slaps the Cuffs" on Chattanooga Shooting Suspect

o+ Illinois Firefighter's Scanner Monitoring Helps Halt Tylenol Cyanide Deaths

o+ etc.

This publication contains commercial advertising. There are ads for antennas and other scanning accessories. There is a definite bias towards Bearcat products. It's funny that the only scanners advertised are Bearcat scanners! The captions under pictures of "radio shacks" containing scanners of many brands only point out the Bearcat scanners.

Apparently, this organization is owned/sponsored by Electra Company, the makers of Bearcat (TM) scanners. The earlier issues of "Scanning Today" (a forerunner of SCAN) carried the message "Entire contents copyright 19XX by Electra Company...." The later issues are "copyright Scanner Association of North America".

From the information printed in the March/April 1983 issue, a one year membership in this organization costs $10, which includes:

- a subscription to SCAN Magazine
- an FCC quick reference frequency allocation chart
- ID card
- membership certificate
- vehicle decal
- bumper sticker proclaiming "Scanners Hear It First"

The address of this organization is:

SCAN
Suite 1212
111 E. Wacker Drive
Chicago, IL 60601

I'm debating whether to join this organization. I could do without the bumper sticker, decals, etc. Are there any other SCAN members out there?

While Radio Amateurs may pick and choose from several large magazines (QST, 73, Ham Radio, CQ), scanner enthusiasts and short wave listeners must be content with a meager selection of lower quality publications.

I've just sent a check for $16.50 to the Radio Communications Monitoring Association (RCMA) in Anaheim CA for a one year membership. This club has no commercial affiliation and is run by volunteers. I will post my comments on the RCMA newsletter when my first issue arrives.

#N:sri-unix:5200009:000:1461
sri-unix!larson   Jul 5 22:59:00 1983

This from QST, July 83:

> The Commisssion has adopted an NPRM in PR Docket 83-485, which would make additional 10-meter frequencies available for amateur repeater operation. The current 29.5-29.7 MHz segment authorized for repeater use would be expanded to include 29.0-29.5 MHz, increasing the number of "channels" from approximately 4 to 17.
>
> The FCC noted that the Further NPRM in Docket 82-83 would expand the 10-M telephony segment to 28.3 MHz, offsetting most of the loss of frequencies to nonrepeater operation caused by this proposal. Further, it specifically requested comments weighing the
>
> - o need for the proposed repeater subband expansion;
> - o impace of the proposed expansion on existing and future repeater and nonrepeater operation;
> - o acceptability of that impact to the amateur community.
>
> - - - - -

Note that this allocation would place repeaters in the satellite down link bands on 10 meters. This would discourage many from trying satellite communication since most of the satellite users either started on Mode A (10 meter downlink), or use it exclusively (myself included).

The lowering of the telephony portion to 28.3 would cause potential problems to the brand new packet-radio activities around 28.3 MHz, since the growth of packet radio could place even greater demands on the non-telephony parts of 10 meters.

Anyone else feel as I do?

Subject: Radio Shack PRO-24 Pocket Scanner
Message-ID: <573@ihuxf.UUCP>
Date: Fri, 8-Jul-83 14:54:15 EDT
Article-I.D.: ihuxf.573
Posted: Fri Jul 8 14:54:15 1983
Date-Received: Sat, 9-Jul-83 17:06:57 EDT
Organization: BTL Naperville, Il.
Lines: 167

This article briefly summarizes my experiences with the new Radio Shack PRO-24 pocket scanner, priced at $99.95. Problems encountered include:

o+ irregularity in plastic belt clip

o+ misalignment of UHF stages as received from dealer

o+ design deficiency in squelch circuit

o+ incompatibility of recommended AC adapter accessory

Cures for these ills, as well as a modification to increase the scanning rate are covered.

Powered by 4 AA penlight cells, this is a 4 channel, crystal controlled receiver which covers the following bands:

o+ 30 - 50 mHz. (VHF Low)

o+ 144 - 174 mHz. (VHF High)

o+ 450 - 512 mHz. (UHF)

Included with the scanner are tri-band helical and telescoping antennas, a plastic belt clip, and an owner's manual (with schematic).

The outward appearance of this Japanese made scanner is identical to previous Radio Shack models (PRO-20A and PRO-21A) which covered only two bands. The circuitry is similar to other Radio Shack and Montgomery Wards models in that the same multi function MC3357P (2nd local osc., mixer, if amp, detector, and squelch) and T3375 selector chips are used. The audio amplification in the PRO-24 is performed by an LM386 chip, whereas pocket scanners in the past have implemented this function through the use of discrete transistor circuitry.

The PRO-24 uses a plastic belt clip, whereas previous scanners of the same ilk have used metal. The 2 holes in both types of clips are the same size and line up, so if the

plastic clip breaks, it may be possible to order the metal one for an older model from your local Radio Shack store. The plastic belt clip and two screws are furnished in a plastic bag. If the owner wants to install the belt clip, she may find that one of the holes is a bit too small. Do not force the screw in, the brittle plastic may crack! Instead, enlarge the hole slightly.

I installed 1 UHF and 3 VHF High crystals. I had no way to accurately measure the sensitivity or selectivity due the unavailability of calibrated signal generating equipment. The sensitivity on VHF High seemed fairly respectable, considering the tri-band helical antenna. Sensitivity on VHF Low could not be determined due to a lack of a suitable crystal in my collection.

UHF sensitivity was dismal. In particular, the local police repeater on 470.3125 mHz, could not be received in many parts of town. I realigned the RF amplifier and mixer stages in the UHF circuitry, which improved UHF sensitivity noticeably. However, the UHF sensitivity still seems a disappointment. In the PRO-24, the front end stages for the 3 bands are all connected together at the antenna. As an experiment, I disconnected the VHF Low front end from the antenna, thinking that the direct coupling of this stage was loading the others down. I again realigned the UHF stages, but could detect no improvement in sensitivity.

The squelch control had an inordinately high amount of hysteresis, resembling "play" in a car steering wheel. This forced me to keep the squelch up at a point which prevented reception of signals of weak to moderate strength. As mentioned previously, the squelch function is performed by a common Motorola chip, which has been used successfully in several previous scanners. An inspection of the schematic diagram, provided in the owner's manual, revealed that for some reason, a low value of resistance (33,000 ohms) was used for R35, which was placed between the squelch output and the noise amplifier input (IC1, pins 14 and

12). This "feedback" resistor was much smaller than the 220,000 ohm resistors used in previous designs. After changing the resistor in my PRO-24 to 220,000 ohms, the amount of hysteresis decreased markedly, and the squelch worked great.

Both the owner's manual and Radio Shack catalog recommend the model 20-189 AC power adapter/charger accessory ($6.95) for use with the PRO-24. This adapter may be used in two ways:

- If plugged into the AC adapter jack on the scanner, the scanner's batteries are disconnected, and the radio is powered from the AC line.

- If plugged into the charger jack on the scanner, the radio circuitry is completely disconnected, and the batteries are charged by the adapter through a current limiting 27 ohm resistor located inside the scanner.

These two jacks are of the coaxial type, and each contains a switch mechanism which is activated upon insertion of the proper size plug.

I bought the recommended accessory, and although it was labeled 20-189A, I was assured that it was indeed the proper adapter, and the 'A' meant that a new vendor was supplying these to Radio Shack. As a precautionary measure, I made a quick check with my Fluke DMM. This revealed a problem: when the adapter was plugged into the scanner, the internal batteries were still connected!

This can cause two unwanted effects:

- If I used the adapter to power the scanner, the batteries would be charging at an indeterminate rate.

- If I used the adapter plugged into the charging socket, the batteries would be placed directly across the 6 volt DC power supply (bypassing the current limiting resistor!) and would indeed enjoy a short life.

The culprit was the connector on the end of the adapter. The outer diameter was just a bit to small to

actuate the switches in the scanner's jacks.

My problem was solved by buying the Radio Shack 6VDC 150 ma. AC adapter (273-1454, $5.95). In addition to having the proper connector, this adapter works well, is cheaper than the recommended one, and can furnish almost twice the current!

The specifications in the owner's manual state that the scanning speed is 6 channels/second, a bit too slow for my liking. I added another 220,000 ohm resistor in parallel with R64. This changed the time constant of the scanning oscillator, increasing the scanning rate.

When fully squelched, a good portion of the battery drain can be attributed to the light emitting diode channel indicators. When the "manual/scan" switch is in the "man" position, my unit draws approximately 27 ma. from the batteries. Following up on a suggestion from Ed Doubek, N9RF, I always leave the PRO-24 in "scan" mode. When I want to listen to just one particular channel, I just lock out the others. This causes a single LED to blink on and off at about a 25% duty cycle, thus conserving battery life.

I bought this scanner at a reduced price, and in summary, after a several hours work, it performed at a level close to my expectations.

Does anyone know what companies manufacture RF field intensity meters?
I am interested in a portable unit for frequencies up to VHF, that
read out in uv/meter.... Not units for measuring levels in cable TV
systems.....

The first apogee burn scheduled for 21:37 UTC today (about a half hour
ago) did not take place. The onboard software detected that the
attitude was slightly out of tolerance, so the computer aborted the burn
sequence. We in the US had a good "fire drill", however. The satellite
was right on the horizon, with enough signal to tell that the beacons
had switched, as they were supposed to for the burn, but not enough
signal to decode the beacons to determine if the burn had actually taken
place! Word that the burn had not actually taken place came shortly
afterwards from Germany.

We'll keep you posted on a new burn schedule...

Well, the battle lines have been drawn! Code or NO-code?
My feelins on the matter are simple. I believe that there
should indeed be a license class that has a theory requirement
but no code test. HOWEVER, this (Experimenter) Class license
should be restricted to the UHF frequencies, NOT VHF! In other
words, they should only be allowed on above 220 MHz. Certainly,
they shouldn't be allowed on 2 meters. Two meters is crowded
enough with people that HAVE gone through the trouble of learning
Morse Code (at least 5 words per minute anyway). Even 220 is getting
a little full in some areas.

While I understand the new radio computer people wanting
to get on the air with their stuff without learning something
they will NEVER use, let them have frequencies that other hams
don't normally use and where they will have to really work at
getting on the air. Hams have always helped push ahead the
state of the art. If these experimenters really want to get
on the lower frequencies then they should take the time to learn
what everyone else does. I refuse to accept the idea that it is
impossible for someone to learn the theory AND Morse code at 5 wpm.
My wife has NO backround in radio, and she did it. C'mon people,
you want to be a ham, do it, its not hard. You don't want to,
fine, but don't expect the privledges that go with being one.

Regarding Bob's comment about satellite use of the 2 meter band:

Yes, we realize this is a problem. However, the current frequencies
available to the Amateur Satellite Service (yes, it is a separate
service apart from the regular Amateur Service, for some reason known
only to the FCC) make it difficult to go elsewhere. Here are the current
VHF/UHF satellite bands:

144-146 Mhz
435-438 Mhz

That's ALL. By worldwide gentleman's agreement, only the segment 145.8 to
146.0 is used by satellites and will be almost fully utilized by
the Phase 3-B Mode B downlink. It will also be shared with the UoSAT telemetry
beacon and the RS and Oscar-8 uplinks. We don't know where we're going
to put PACSAT, but we'd sure like to find a place for it on 2m also....

6 meters is not a worldwide amateur band; neither is 146-148
Mhz or 220-225 Mhz. The next available allocation is on the 23 cm band.
Phase 3-B will use 2m, 70cm and 23cm; where else can we go?

Part of our problem is that our users have always screamed bloody murder
whenever a new satellite is proposed to use a higher frequency band.

Some users have never forgiven us for having decided to put no more downlinks on 10m, and others are just now getting the capability to use the 70cm/2m pair. Now, of course, we are asking them to get 23cm transmitters for mode L and the furor is starting again. However, this is the only way we can provide wide transponders: 800 khz on mode L (23cm up, 70cm down) as compared to 150khz for mode B (70cm up, 2m down).

Two meters sure is a useful frequency band. A shame it isn't 10 Mhz wide.

After reading Mr. Gilmore's open letter to the FCC serveral thoughts come to mind. For brevity they are enumerated below:

1) There should be a NO-CODE license, BUT I don't consider it a canidate
     as a class of
     as a class of AMATEUR RADIO SERVICE. I would be happy for the
     NO-CODE folks to have a separate frequency allocation.

2) NO-CODE is supposed to bring on the air a number of people with "great"
     contributions and those who can bring those ideas to life. Can
     5 WPM code be a significant hurdle to an "interested" person, if
     it is maybe the person isn't that intereseted. Mr. Gilmore by
     his addmission lost interest quickly.

3) John, your talking in this forum to ALOT of software folks. I don't
     think its a great discovery that current RTTY software is very
     primative. It was designed to be upward compatable with other
     amateurs old equipment. Not every one can
     run right out and by a computer, although that time is getting
     very close. Remember its amateur RADIO, -NOT- amateur COMPUTER.

4) I am concerned about your statement that your machine will retry, and
retry, and retry if the conditions are poor. Sure you can put
in retry counts ... but what if I am trying to handle priority
traffic on that frequency ... will your system go off the air
at my request ... so I can work the priority traffic your station
can not hear. What do you think will happen the first time a
life is lost because a digital station did not QRT (thats stop
transmitting).

5) I want a digital world wide computer network, but not at the expense
of the amateur radio service.

The following are my comments to FCC NPRM Docket 83-28. I would
appreciate any and all comments regarding this approach
to this issue.

> Incorporating new technology into amateur radio is the
> thrust of the FCC's efforts to formulate a new class of
> license. The argument of a code versus no-code license is a
> side-issue. The real issue is how to incorporate the newer
> data communication technologies desired by some prospective
> hams, while preventing the chaos caused by unskilled and
> frivolous operations as has happened in the CB service. The
> following proposal can achieve both objectives:
>
> > The new class of license to be created, whether
> > entry level or greater, should be a no code
> > license, allowing all currently accepted data
> > communications modes with no voice privileges
> > (A3,A3J,F3) with the exception of P3G in the
> > appropriate bands. If these "data communicators"
> > should ever wish to have code and/or voice
> > privileges they may take the appropriate exam..

By eliminating A3 and F3 (i.e., the technologically simple voice modes), the incentive for frivolous users to somehow obtain a license is removed.

This proposed license will effectively discriminate between those seriously intent on using data communications and those who's interests are, by-in- large, frivolous uses of voice mode just because it is available and easily obtainable.

Well, it looks like another round of tear-jerking stories of a world
full of potential Albert Einsteins being heartless denied their
fulfillment by the impossible barrier of 5 words per minute CW.

Just a note on historical freedoms on radio:

1) CB licenses can be had for 2 boxtops and 25 cents. Gab on...

2) 49 Mhz is open to anybody, so long as power is below 100mw.

3) Higher Class CB (Class A?) at 460 Mhz is available.

4) AM (540-1600 Khz) and FM (88-108 Mhz) are there for low power
   use, though I think this is now discouraged.

With these freebies, you can have a ball. If you want to have the
privileges which hams have Earned, you will have to Earn them, too.
Yes they are privileges, and when (if) you study the part 97 in
preparation for Your ham license, you will see this is acknowleged
as an earned privilege. Throwing these pearls before the world
may well destroy this resource from any useful purpose, like
uncontrolled exploitation of other of the nations resources.

Count me on the 'earn your ticket' side of the question...

Phil's comments and suggestions are by far the best and most thought provoking of any I've seen on no code licenses. For too long all discussion has been centered around the "digital" no code license while overlooking (ignoring) other types of experimentation. When I first started in ham radio, I had lots of fun and learned quite a bit while playing with a converted APX-6 on 1296 mHz (it was fun to communicate 5 miles across town with a 1.5 inch antenna on both ends). I think it is vital to the future of ham radio to encourage all types of experimentation--not just digital.

I especially like the suggestion for two flavors of license with different levels of difficulty and the use of existing theory exams for them. I think its time that the FCC should do something to encourage technical development instead of continually discouraging it.

_C_o_c_o_s__K_e_e_l_i_n_g_. VK9YB has been showing up on 14225 kHz at 1200Z.

_G_u_a_m_. Look for AH2AI on 3.8 MHz at 1200Z.

_G_u_i_n_e_a_. LA2EX/3X1 is still checking in with the Family Hour on 21345 kHz at 2330Z.

_E_a_s_t_e_r__I_s_l_a_n_d_. Hector, CE00ERY, can be found on 14208 kHz at 0300Z. QSLs go via WB6WOD.

_E_a_s_t__M_a_l_a_y_s_i_a_. San, K5YY, has left Brunei and his next stop is expected to be at 9M6. Look for him on 3795 kHz at 1100 and 1200Z and on 40 meters at 1130Z.

_A_s_c_e_n_s_i_o_n_. ZD8DX operates on 14205 kHz at 2300Z. QSLs go to W4MJZ.

_V_P_5_/_V_P_2_. VP5KMX is still active. QSL to W8UVZ. VP5KMD is particularly active on 7005 kHz at 0030Z. Also look for him on 3505 kHz at 0100Z. QSL via N00DH. K7NHV/VP2V is active on all bands, cw only. VP2KBD and VP2KBE will be on until March 15. QSL to K1IJV.

_S_p_r_a_t_l_y__I_s_l_a_n_d_s_. Four German amateurs are departing for the Spratly Island group on March 31. They expect to arrive at their destination on April 7 or 8 and operate through April 12. The calls used will be 1S6SI, 1S6NG, 1S6KF, and 1S4EI. QSL routes will be announced later.

_V_S_5_/_V_S_6_/_9_M_6_. VS5HG, VE7ZG/VS6, and 9M6YY will be on Saturday, Sunday, and Monday at approximately 1100Z on 3795 kHz ssb. 80 meter cw and 40 meter operation is also planned.

_S_t_.__H_e_l_e_n_a_. ZD7WT operates on 7002 kHz at 0100Z. QSL via ZD8TM.

_R_o_d_r_i_g_u_e_s_. Alex, 3B8DA/3B9, plans to continue on Rodrigues Island until May.

_D_X_C_C_. QSLs for SM00AGD/KH1 and T31AE are now being received from QSL manager SM3CXS and are being accepted for DXCC credit.

_M_a_u_r_i_t_a_n_i_a_. 5T5TO has been worked on 21030 kHz at 2150Z and on 28025 kHz at 1900Z. He is also active on 80, 40, and 20 meters. F6BUM handles the QSLs.

_H_e_a_r_d__a_n_d__W_o_r_k_e_d_. AP2JL 21275 kHz at 1200Z. J6LCV 3795 kHz at 0100Z, QSL to KA6DFI. EA9JV 3790 kHz at 0120Z.
DF3NV/ST2 14273 kHz at 2250Z. VE7CZU/4U 14225 kHz at 2300Z.
3V8PS 14201 kHz at 2250Z. FR00FLO 14224 kHz at 2250Z.

I think Larry has hit a the solution. If all they want is to experiment with the new forms of communications. Then they should be limited to them. It solves my main concern, that is another CB band on 2 meters. And just after I got an HT.

In response to Chris and Bob's comments, which were essentially "if I
can do it, then you should too":

The issue is not the absolute degree of difficulty of passing the code
test. The real issue is whether even the small (although I might
dispute that) amount of work required to learn the code is worth it,
when compared to the other things (such as theory) one might be learning
during the same time.

I learned the code and got my ticket when I was in high school; if I had
waited until I had gone on to college when I had far less free time, I
might never have become a ham. Getting started was so time consuming
that I can very well understand why many others refuse to learn the
code.

Amateur radio has often been called a "fraternity". That description is
more than a metaphor, as the code test is our very own version of
hazing. I fought against hazing in my college fraternity, both before
and after I joined, and I'm fighting against it in amateur radio now.
If you want to put up some kind of "test of character" to make sure only
dedicated people enter, fine. Just make it a worthwhile exercise such as
increasing their technical skills, not one which to a newcomer makes no sense.

I believe there are such things as telephones which have headsets instead
of a big clunky receiver that you have to hold with your hand. Can

anybody enlighten me further? There are times when I dearly wish I
had such a thing. (I have no access to phone-company internal gear,
so it would have to be something commercially available to the public.)
Please reply by mail; I will summarize for the net.

I have received a copy of the FCC's NRPM on the no-code license, reprinted in the March 1983 issue of the AMRAD newsletter. Unfortunately, I cannot determine for sure from the reprint the date of the Federal Register in which this NPRM was printed. While the whole thing is much too long for me to type in here, I would like to quote a few sections. These all come from the later sections marked "Discussion" and "Conclusion".
73,
Phil

"Essentially, we will be considering the authorization of the same frequencies for whichever codeless license we may implement. There are, then, only two principle differences between our proposed codeless Technician class and Experimenter class operator licenses. These are the subject and level of the written examination to be administered to the applicant, and the total number of operator license classes to be provided for in the Amateur Radio Service....

"...we must point out that the Technician class license proposal has an advantage over the Experimenter class license proposal. Implementation of the Experimenter class license may require the Commission to develop a new syllabus and provide, by some means, for the preparation and administration of new examinations... We would be remiss if we did not consider these administrative burdens in weighing the respective desirability of the two license classes proposed. Accordingly, we request that this matter be addressed in the context of comments on this proceeding. Finally, the Commission does not wish to de-emphasize the importance of the international Morse code as a communications mode in the Amateur Radio Service...it is precisely these attributes [the universality and efficiency of CW] that make us believe that Morse code can 'stand on its own two feet.' We believe that once an individual has had an opportunity to become involved in the Amateur Radio Service and become acquainted with its many intricate facets, there is a desire to learn more about radio and the offerings of the service. We anticipate that in the case of the codeless class licenses these new interests may include the international Morse code, just as we anticipate with all other licenses...

"Beyond station identification and use in certain weak signal communications modes, we note that the Morse code is seldom used on frequencies above 50 Mhz, even though all amateur operators are currently required to demonstrate their proficiency in it prior to licensing. We then ask why the Federal Government should continue to require of operators a skill which may have less utility than other skills in these bands for which the license would be granted to operate. We do not, for example, require applicants to demonstrate proficiency with a typewriter even though radioteleprinting may be the most efficient mode for certain 'traffic' handling. We believe that a more important qualification for an operator license is an individuals

ability to understand the Commission's regulations and the radio station for which he/she is responsible. Other than this, we would leave to the individual the decision as to whether learning the Morse code would benefit his/her endeavors in amateur radio.

"...It has also come to our attention that some of the current amateur licensees are particularly concerned that even if a codeless license class were to convey privileges only in the VHF bands and higher, that those privileges might include certain well populated bands (e.g., the popular 2 meter band). With respect to this, we wouldlike to reemphasize that we plan to be flexible on the issue of frequencies that would be authorized for the codeless license class (in particular the Experimenter class, since we are not considering changes in the privileges for Technician class licensees). We will carefully consider the comments of both amateurs and non-amateurs on this issue and make appropriate adjustments in the frequency bands eventually authorized."

There is code on FM TOO. I think that the operator should be
able to copy the call on my repeater. Not to mention the various
other helpfull messages it produces in code.
Enough is said I will listen again.

As a historical comment, ... CB was not created out of non-ham radio
spectrum. It was taken from ham radio. It was the old 11 meter
ham band. I've been a ham for only 19 years or so, & it was already
taken away back then.
Once upon a time I used to have a Heathkit DX-100 (now known
as boat anchor) that had 11 meters on it. Next time you are at a hamfest
look at those B.A.'s! Perhaps there are some old-timers on the net that
can enlighten upon the political reasons for CB creation and such, so
that we can see how the situation then compares with the no-code situation now.

Subject: Traffic Query -- Responsibility of Handlers
X-Google-Info: Converted from the original B-News header
Posted: Tue Mar 15 19:54:17 1983
Received: Wed Mar 23 00:11:57 1983

I just delivered a piece of traffic tonight which I picked up from
one of our local nets, and its contents got me thinking (yes, it's
hard to start those gears, but on occasion...): Generally, it was
a request from a person (dunno whether or not it was the actual
originator of the message) for the recipient to deliver a phone
number to the author of the message. Now, how do I know that that
phone number is not going to be used by the author for a business
application? Clearly, that's a violation of the rules. Granted,
if the author is the originator of the message, he should know
better, and if the author is not the originator, it should be the
originator's responsibility to make sure that the message does
not break any rules. But, in the rare case that something like this
DOES get through, what is the implication for those people who
handle the message (the people between and including the originator
and the deliverer)? If the FCC finds that a piece of traffic breaks
some rule(s), are the handlers of that traffic equally responsible
for it and are they subject to punishment? e.g. If that phone number
IS for business, and the FCC finds out about it, can I, as a handler
of the traffic and the person who delivered it, get in trouble for
it?

UOSAT SPACECRAFT OPERATIONAL STATUS:
****
**** UOSAT BULLETIN-17 1500 GMT 18 MARCH 1983 ****

** S/C NEWS **

FOLLOWING PRECISE NAVIGATION ANALYSIS AND ATTITUDE MANOEUVRES DURING MARCH 3-6TH, UOSAT WAS SUCCESSFULLY ORIENTED IN THE CORRECT MANNER AND TIME FOR GRAVITY GRADIENT STABILISATION. BOOM DEPLOYMENT COMMENCED OVER SURREY AT 03:58:15 GMT. AT 04:00:35 HIGH SPEED DATA INDICATED THE CABLES FROM THE SPACECRAFT TO THE TIP-MASS MAGNETOMETER ON THE END OF THE BOOM TO HAVE SNAGGED AND BOOM DEPLOYMENT WAS HALTED IMMEDIATELY AT ONE METRE EXTENSION. THE NAVIGATION AND ATTITUDE OF UOSAT WAS SO PRECISE HOWEVER THAT THE SPACECRAFT SUCCEEDED IN BECOMING GRAVITY-GRADIENT STABILISED FOR APPROX ONE DAY EVEN THOUGH THE BOOM WAS ONLY EXTENDED 1 RATHER THAN 4M. THE GRADUAL INCREASE IN Z-SPIN CAUSED UOSAT TO SLIP OUT OF LOCK ON 8 MARCH. DETAILED ANALYSIS IS UNDER WAY AND ATTEMPTS WILL BE MADE TO RELEASE THE CABLES.

Sorry to bother ARPA people twice, but somebody filters ARPA to UUCP news out.
I am looking for the "official" specs for AX.25. Everybody seems to handwave
and say it's like X.25 but...but what. A friend of mine is making a product
to do this stuff and need the details. Is there an official document for this
spec or is it still on the back of a napkin... Somebody please point
me to this magic document, electronically or even through the U.S. Snail.

Agreed. CW is indeed extremely useful for small signal work on VHF and
UHF: moonbounce and satellite users use it heavily. Dave's comparison
to addition and calculus isn't really appropriate, as the point is that
the code is not really necessary for MOST (not all) of the work
currently conducted on VHF and above, and certainly not necessary for
most of the experimental work.

I would think twice about calling the case for the code-free license

"juvenile". Even disregarding my position in favor of it, I have noticed that most of the OPPONENTS of the code free license are far more emotional and "juvenile" in their arguments than are the proponents, although of course this doesn't constitute an argument in favor of it.

It seems we have an interesting situation here: many amateurs fervently support the code requirement as a "test of dedication", while at the same time saying that the code is "so simple that even a Boy Scout can learn it". So its both hard and easy at the same time; which is it?

I stand by an earlier remark I made: a lot of the opposition to the code free license is based on a fear of others who might prove to be more technically competent than themselves. These amateurs cling to the code test as a way to "prove" to themselves that they're still somehow superior. Recent comments calling the proponents "juvenile" and "lazy", or mocking them as "experts" or "Einsteins" simply confirm my suspicions. Its sad that people feel this way.

qst de ad7i
hr propagation forecast bulletin nr 12 from arrl headquarters
newington ct march 21, 1983
to all radio amateurs bt

solar flux information was not available in the 24 hours prior to preparation of this bulletin, but visual observation of the sun indicated that flux values are continuing a gradual rise that began march 14. the flux was estimated at 127 on the 20th, and a peak of about 140 is expected by march 27. the flux average for march 20 to 31 is expected to be above the 123 used in preparing the propagation charts in qst for march.

geomagnetic activity was at intermediate levels and propagation waso fair to good through the 18th. it was higher, and conditions were degraded, march 19 and 20. propagation will remain below par through the 21st, but will improve thereafter, becoming good march 26 and 27. the month will close with erratic conditions carrying through april 2. communications over high latitude paths will be affected most adversely. transequatorial circuits may be enhanced, particularly on 28 and 50 mhz, the latter having been open to south america during march, especially from the southern tier of states.

american sunspot numbers for march 10 through 16 were between 8 and 58 with a mean of 36.9 ar

Last weekend, JAMSAT and JARL (the Japanese branch of AMSAT and the Japanese Amateur Radio League) formally announced a project to build an amateur radio satellite for launch in 1986 aboard a new Japanese launch vehicle, the H-1 (similar to the American Delta).

The satellite will physically resemble Oscar-8, and carry two communications payloads. One will be a Mode J 2m-to-70cm linear transponder like that on Oscar-8, and the other will be a digital store-and-forward "mailbox".

The digital half of JAS-1 will be in addition to the similar PACSAT project being planned in the US for one of three launch possibilities: aboard a Space Services launcher, a Delta with Landsat D', or aboard the Landsat 4 Recovery shuttle mission from Vandenburg.

Discussions have been underway between AMSAT and JAMSAT for some time to establish common modulation, protocols and user interfaces wherever possible for PACSAT and the digital portion of JAS-1 in order to minimize user inconvenience.

Launch of JAS-1 is planned for early 1986 into a 1500 km altitude, 50
degree inclination orbit. Note that this orbit will NOT be
sun-synchronous, unlike that planned for PACSAT.

Phil Karn, KA9Q

Phil,
  Let me say at the start that I do not support the code free license.
Yes, I agree, it is an emotional issue to me. My arguments can not be
supported in hard fact.
  In reference to the code being easy (for a Boy Scout) and hard (a test

of dedication) at the same time, it was never stated that the Boy Scout did not need the same dedication to learn the code. In fact, from my own experience in a Scout type orginazation, only the most dedicated of us learned all the letters and the instructor dissappeared before any of us learned it at 5 wpm, thus ending the class. As I'm sure you know, learning the code is easy for some people while being difficult for others. This is of course the same for the theory.

I also agree with you that Dave's (WN9NBT) comparison to addition and calculus isn't really appropriate, so let me give a comparison that seems better. I am a private pilot. One of the requirements for the license is the ability to read weather charts. I find the weather charts very complex and difficult to read. In fact, every time I read a weather chart, I must to some extent relearn how to read them. In actual use of an airplane, I am restricted to VFR (and good weather). Also, every time I need the weather charts, the people at the flight service station will read them for me. I suspect that 95% of all private pilots never NEED to read a weather chart to conduct a safe flight. But I will not recommend that this requirement be removed, even though this area was the most difficult part of earning the pilot's license for me.

In reply to your remark "a lot of the opposition to the code free license is based on a fear of others who might prove to be more technically competent than themselves." First of all, I think I am reasonably technically competent. Secondly, I would hope that hams as a general rule, would not be so insecure that more technically competent people would pose a threat to them. I believe that a lot of the opposition to the code free license is based on the fear of the results of removing requirements in light of the history of the CB band.

Thank you for tolerating my point of view.
Phil WB6OHF/7

To Phil, WB6OHF/7:
Thanks for your well thought out reply.

I would point out that your comparison to pilots being required to read weather charts is not really relevant either, as being able to do so is

probably a safety consideration. How much money and time should be spent on safety measures is an entirely different philosophical issue that I don't want to get into here. If the only basis for an amateur license test was safety, then the theory examinations would be even simpler than they currently are.

The point is often made that amateur radio would immediately degenerate to CB if a code free license were made available; my point is simply that there are more relevant things (such as stiffer theory exams requiring the same amount of preparation) that could replace the code requirement as a "test of dedication". It is only after I saw this point of view rejected that I began to suspect the "technical insecurity" I alluded to in my previous comments.

AX.25 LEVEL 2 PROTOCOL

Terry Fox, WB4JFI
Vice-President, AMRAD
1819 Anderson Road
Falls Church, VA 22043

Abstract

This paper contains the latest draft of the AX.25 protocol specification. This is the first public release of this draft. Earlier drafts have been given to specific inviduals for comment and as a reference for software development. Changes should be expected. Please check the AMRAD Newsletter for announcements of later versions.

History

Over the years there have been several protocols suggested for use at layer 2 of the ISO Open System Interface Reference Model (OSI-RM) over Amateur Radio. The one system that has been in use is based on the IBM SDLC protocol, and it has been working as far as it went. One of the immediate problems that came up with SDLC was that its address field of SDLC is very limited (being one byte long), causing problems if there are many amateurs on at a time.

Trying to come up with a protocol that everyone would agree to seemed like an almost impossible task a year ago. What we at AMRAD decided to do was to go over the various protocols in use or available to the amateur, figure out the best and worst parts of each protocol and see if the proto col could be "enhanced" to work properly over the amateur radio enviroment. After reviewing the various protocols around and talking with people in the computer networking industry, we decided to push the X.25 standard, modified to allow a larger address field. At about this time, a group of amateurs in New Jersey were coming to the same conclusion, so about mid-June of 1982 the two groups got together and after two weekends came to an "understanding" on a level 2 protocol. The most delicate part of the negotiations between the two groups concerned the name to be given this protocol. In order to not step on anyones toes, it was decided to call the protocol AX.25, which stands for Amateur X.25.

The next step in the evolvement of AX.25 was that in October of 1982, AMSAT hosted a gathering of some of the leaders in amateur packet radio. AMRAD was at the meeting, along with representatives from TAPR, SLAPR, AMSAT, and PPRS. Three days of intense discussion followed, and an agree-

ment was finally reached on a nation-wide compatible protocol. AX.25 was then modified to be compatible with this new protocol (basically the only major changes were an additional extension of the address field, and the addition of a Protocol IDentifier, or PID field).

The rest of this paper will describe the basics of the AX.25 level 2 protocol.

AX.25 Layer 2 Protocol Specifcation

This protocol conforms with the ISO Recommendations 3309, 4335 (including DAD 1&2) and 6256 high-level data link control (HDLC) and uses some terminology found in these documents.

This protocol also conforms with ANSI X3.66, describing ADCCP, balanced mode.

This protocol is written to work equally well in either half- or full-duplex amateur radio enviroments.

This protocol has been written to work equally well for either point-to-point connections, or connections made thru a larger device, such as a metropolitan network controller (MNC).

This protocol does allow the establishment of more than one layer 2 (link layer) connection per device, if the device is so capable.

This protocol also follows in principle the CCITT X.25 recommendation, with the exception of an extended address field and the addition of the Unnumbered Information (UI) frame.

Most layer 2 protocols assume that one large device (generally called a DCE, or data circuit-terminating equipment) is connected to several smaller devices (usually called a DTE, or data terminating equipment). AX.25 assumes that both ends of the link are balanced, thereby eliminating the two different classes of device.

Frame_Structure

Level 2 packet-radio transmissions are sent in small blocks, called frames. These frames are made up of smaller parts, called fields. Fig. 1 shows how the three types of frames are made up.

Fig. 1 shows the frames in the same bit order that most packet articles show them. Unfortunately, this method has led to some confusion, since the least-significant bit (LSB) is to the left rather than to the right, as most people would ordinarily assume. I am pointing this out early in this paper to prevent mass confusion as I progress. Later on, I will switch to a hopefully more under standable way of showing the frame ans its compo nents.

Field_Definitions

The frame is made up of several parts, called fields. Each of these fields is made up of an integral number of octets (or bytes), and serves a specific function.

Flag_Field

Since amateur packet radio is a bit-oriented protocol, the only way to tell when one frame is over and another is starting for sure is to delimit each frame with a certain bit sequence both at the beginning and the end. This is the job of the flag field. A flag consists of a zero followed by six ones followed by another zero, or 01111110 (7E hex). Due to the bit stuffing mentioned above, the only time this sequence is allowed is at the beginning and end of a legitimate frame.

Address_Field

The address field is used to identify both where the frame came from and what the destination of it is. In the CCITT recommendation X.25, this field is only one octet long. This permits at most 256 users per level 2 channel, and since some bits of this field were used for other purposes, the real number of users were about thirty per level 2 channel. Both the HDLC and ADCCP recom-mendations allowed the address field to be ex-tended, so we decided to extend the address field per their recommendations in the amateur version of X.25 to include the callsigns of both the destination and source amateur radio stations.

The method used to extend the address field will be described shortly.

Control_Field

The control field is used to identify the type of frame and control several attributes of the level 2 connection. It is one octet in length, and its encoding will be discussed in a following section.

PID-Field

The Protocol Identifier (PID) field is used only in information frames, and identifies what kind of layer 3 protocol, if any, is in use. Its encoding is as follows:

MSB LSB	
xx00xxxx	Reserved at the moment.
xx01yyyy	AX.25 layer 3 implemented.
xx10yyyy	AX.25 layer 3 implemented.
11110000	No layer 3 implemented.
11111111	Escape character. Next byte contains more PID information.

Where:

1. An x indicates a "don't care" bit.
2. A y indicates all combinations used.

Information_Field

The information field is used to convey the actual user data from one end of the link to the other. I fields are allowed in only three tyes of frames, the I frame, the UI frame, and the FRMR frame. The I field can be up to 256 octets long, and should be an even multiple of octets long. Any information in the I field should be passed along the link totally transparently, except for any zero-bit insertion necessary to prevent flags from accidentally appearing in the I field.

Frame_Check_Sequence

The frame-check sequence is a sixteen-bit number calculated by both the sender and receiver of a frame. It is used to make sure that the frame was not corrupted by the medium used to get the frame from the sender to the receiver. It is calculated in accordance with ISO 3309 (HDLC) recommendations.

Bit_Stuffing

In order to assure that the flag sequence mentioned above doesn't accidentially appear any where else in a frame, as the frame is being sent it should be monitored, and if more than five contiguous ones are detected, a zero bit should be added between the fifth and sixth ones, eliminating the possibility of a flag appearing in the frame other than where it belongs. The receiver of five ones, a zero, and more ones should automatically eliminate the inserted zero before passing the data on.

Bit_Order_of_Transmission

With the exception of the FCS field, all other fields in an AX.25 frame should be sent starting with the least-significant bit. In accordance with HDLC practices, the FCS should be sent most-significant bit first.

Frame_Abort

If a frame must be prematurely aborted, at least fifteen contiguous ones should be sent with no bit stuffing added.

Invalid_Frames

Any frame consisting of less than 136 bits, or not bounded by opening and closing flags, or not octet aligned (an integral number of octets) should be considered an invalid frame by the link layer.

Address_Field_Encoding

The address field of all frames should be encoded with both the destination and source amateur callsigns of the frame. If a level 2 amateur "repeater" is to be used, its callsign should also be in the address field. AX.25 follows the HDLC recommended method of extending the address field in order to fit all this information into the address field.

Basically, the way the HDLC address field is extended beyond one octet is to reserve the least-significant bit of each octet for what is called an "extender bit". This bit is set to zero if the next octet contains more address field information, and is set to one if this is the last octet. To make room for this extender bit, the amateur radio call sign information is shifted one bit to

the left.

The actual encoding techniques for both non-repeater and repeater operation follows.

Non-Repeater_Address-Field_Encoding

If a level 2 repeater is not being used, the address field is encoded as shown in Fig. 2. The destination address is the call sign of the amateur radio station that the frame is addressed to, while the source address contains the amateur call sign who sent the frame. These call signs are the call signs of the two ends of a level 2 AX.25 link only, not of any other station, such as the destination of a packet going thru an intermediary link. Those addresses should be in a higher layer, not layer 2.

A1 thru A14 are the fourteen octets that make up the two address sub-fields of the address field. The destination sub-address is seven octets long (A1 thru A7), and is sent first. This will allow the receivers of the frame time to check the destination address sub-field and see if the frame is for them while the rest of the frame is being received. The source address sub-field is then sent in octets A8 thru A14. Both of these sub-fields are encoded in the same manner, except for the last octet having the HDLC address extender bit set. Since they are basically the same, only the destination sub-address will be outlined.

There is an extra octet at the end of each address sub-field that allows room for a Secondary-Station Identifier (SSID) and three additional bits for future expansion. The SSID field allows an Amateur Radio operator to have more than one packet radio station. This is useful when an amateur wants to put up a repeater in addition to his regular station for example.

Appendix A shows a typical AX.25 frame in the non-repeater mode.

Destination Sub-Field Encoding

Fig. 3 shows how an amateur call sign is placed in the destination address sub-field, occupying octets A1 thru A7.

| Octet | ASCII |Bin.Data|Hex Data|

```
-----------------------------------
|  A1   |   W   |10101110|   AE   |
|  A2   |   B   |10000100|   84   |
|  A3   |   4   |01101000|   68   |
|  A4   |   J   |10010100|   94   |
|  A5   |   F   |10001100|   8C   |
|  A6   |   I   |10010010|   92   |
|  A7   | SSID  |0RRSSID0|        |
-----------------------------------
Bit Position-->  76543210
```

Fig. 3. Destination Field Encoding

Where:

1. The top octet (A1) is the first octet sent (sort of like popping it off the top of the stack), with bit 0 of each octet being the first bit sent, and bit 7 being the last bit sent.

2. The first (low order or bit 0) bit of each octet is the HDLC extender bit, which is set to zero on all but the last octet in the address field, where it is set to one.

3. The bits marked "R" are reserved bits. they may be used in an agreed upon manner in individual networks. If they aren't implemented, they should be set to one.

4. The characters of the callsign should be standard seven-bit ASCII (upper case only) before being shifted left to make room for the extender bit. If the callsign is less than six characters long, it should be padded at the trailing end with ASCII spaces between the end of the callsign and the SSID octet.

5. The SSID portion of the last octet has been intentionally left vague at this point, and is left up to the individual station to assign. The only recommended restriction is to reserve the all-one condition (1111) for an all-call SSID in case one wants to reach an amateur but dooesn't know what SSID that amateur operates under.

Level_2_Repeater_Address-Field_Encoding

If a frame is to go thru a level 2 amateur packet repeater, there is an additional address sub-field added to the end of the address field. This additional sub-field contains the call sign of the repeater to be used. This will allow more than one repeater to share the same rf channel, which has been a problem with the older protocols. If this field exists, the last octet of the source sub-field has its extender bit set to zero, indicating that more address-field data follows. The repeater address sub-field is encoded in the same manner as the destination and source address sub-fields, except for one bit in the last octet, called the "H" bit. The H bit is used to indicate whether a frame has been repeated or not. This is necessary to prevent someone from potentially receiving two identical frames, the one going to the repeater, and the one coming back from the repeater. Fig. 4 shows how the repeater address sub-field is encoded. Appendix B is an example of a complete frame on its way back from a repeater.

Octet	ASCII	Bin.Data	Hex Data
A15	W	10101110	AE
A16	B	10000100	84
A17	4	01101000	68
A18	J	10010100	94
A19	F	10001100	8C
A20	I	10010010	92
A21	SSID	HRRSSID1	

Bit Order --> 76543210

Fig 4. Repeater Address Encoding

Where:

1. The top octet is the first octet sent, with bit 0 being sent first, bit 7 sent last of each octet.

2. As with the source and destination address sub-fields discussed above, bit 0 of each octet is the HDLC address extender bit, which is set to zero on all but the last address octet (A21) where it is set to one.

3. The "R" bits are reserved just like in

the source and destination sub-fields.

4. The "H" bit is the has-been-repeated bit. It is set to zero on a non-repeated frame, and set to one by the repeater when the frame has been repeated.

It should be noted that some of the advantages of this addressing scheme are mentioned in Appendix C.

Control_Field_Formats

The control field is responsible for identifying what type of frame is being sent, and is also used to convey commands and responses from one end of the link to the other to maintain proper control over the link.

The control fields used in AX.25 use the CCITT X.25 control fields for balanced operation, with an additional control field taken from ADCCP to allow connectionless and round-table operation.

There are three general types of AX.25 frames. They are the Information frame (I frame), the Supervisory frame (S frame), and the Unnumbered frame (U frame). Fig. 5 shows the basic format of the control field associated with these types of frames.

Control Field	Control Field Bits							
Type	7	6	5	4	3	2	1	0
I Frame	N(R)			P/F	N(S)			0
S Frame	N(R)			P/F	S	S	0	1
U Frame	M	M	M	P/F	M	M	1	1

Fig. 5. Control Field Formats

Where:

1. Bit 0 is the first bit sent, bit 7 is the last bit sent of the control field.

2. N(S) is the send sequence number (bit 2 is the LSB).

3. N(R) is the receive sequence number (bit 6 is the LSB).

4. The "S" bits are the supervisory function bits, and their encoding is discussed below.

5. The "M" bits are the unnumbered frame modifier bits and their encoding is discussed below.

6. The P/F bit is the Poll/Final bit. Its function is described in more detail shortly.

Control_Field_Definitions

Information Frame Control Field

All I frames have bit 0 of the control field set to zero. N(S) is the sender's send sequence number (the send sequence number of this frame). N(R) is the sender's receive sequence number (the sequence number of the next expected received frame. These numbers are described in the section regarding flow control.

Supervisory Frame Control Field

Supervisory frames are denoted by having bit 0 of the control field set to one, and bit 1 of the control field set to zero. S frames provide supervisory link control such as acknowledging or requesting retransmission of I frames, and link level window control. Since S frames don't have an information field, the sender's send variable and the receiver's receive variable are not incremented for S frames.

Unnumbered Frame Control Field

Unnumbered frames are distinguished by having both bits 0 and 1 set to one. U frames are responsible for maintaining control over the link beyond what is accomplished with S frames. They are also responsible for the establishment and tearing down of the link. U frames also allow for the transmission and reception of information outside of the normal flow control. Some U frames may contain information fields.

Control_Field_Parameters

Sequence_Numbers_and_Variables

Every AX.25 I frame shall be assigned a sequential number from 0 to 7. This will allow up to seven outstanding I frames per level 2 connection at a time.

Send_State_Variable_V(S)

The send state variable is an internal variable that is never sent. It contains the next sequential number to be assigned to the next transmitted I frame. This variable is updated upon the transmission of each I frame.

Send_Sequence_Number_N(S)

The send sequence number is found in the control field of all I frames. It contains the sequence number of the I frame being sent. Just prior to the transmission of the I frame, N(S) is updated to equal the send state state variable.

Receive_State_Variable_V(R)

The receive state variable is an internal variable that contains the sequence number of the next expected received I frame. This variable is updated upon the reception of an error-free I frame whose send sequence number equals the present received state variable value.

Received_Sequence_Number_N(R)

The received sequence number is in both I and S frames. Prior to sending an I or S frame, this variable is updated to equal that of the received state variable, thus implictly acknowledging the proper reception of all I frames up to and including N(R)-1.

Poll/Final_(P/F)_Bit

The P/F bit may be used in all types of frames. It is used in a command (poll) mode to request an immediate reply to a frame. The reply to this poll is indicated by setting the response (final) bit in the appropriate frame. Only one outstanding poll condition per direction is allowed at a time.

Control_Field_Encoding

Information_Frame_Control_Field

The information frame control field is encoded as shown in Fig. 6. These frames are sequentially numbered to maintain control of their passage over the link level connection.

Control Field Bits

7 6 5	4	3 2 1	0
N(R)	P/F	N(S)	0

Fig. 6. I Frame Control Field

Supervisory_Frame_Control_Field

The supervisory frame control fields are encoded as shown in Fig. 7. In AX.25, S frames are used only as responses to other frames.

Control Field Bits	7 6 5	4	3 2	1 0
Receive Ready RR	N(R)	P/F	0 0	0 1
Receive Not Ready RNR	N(R)	P/F	0 1	0 1
Reject REJ	N(R)	P/F	1 0	0 1

Fig. 7. S frame control Fields

Receive_Ready_(RR)_Response

Receive Ready is used to do the fol lowing:

1. To indicate that the sender of the RR is now able to recieve more I frames.

2. To acknowledge properly received I frames up to, and including N(R)-1.

3. To clear a previously set busy condition created by an RNR command having been sent.

It should be noted that the status of the other side of the link can be requested by setting the poll bit.

Receive_Not_Ready_(RNR)_Response

Receive not ready is used to indicate to the sender of I frames that receiver is temporari-

ly busy and cannot accept any more I frames. Frames up to N(R)-1 are acknowledged. Any I frames numbered N(R) and higher that might have been caught in between and not acknowledged when the RNR command was sent are NOT acknowledged.

The RNR condition can be cleared by the sending of a UA, RR, REJ, or SABM frame. The P/F bit can be used within the RNR frame to interrogate the status of the other side of the link.

Reject_(REJ)_Response

The reject frame is used to request retransmission of I frames starting with N(R). Any frames that were sent with a sequence number of N(R)-1 or less are acknowledged. Additional I frames may be appended to the retransmission of the N(R) frame if there are any.

Only one reject frame condition is allowed in each direction at a time. The reject condition is cleared by the proper reception of I frames up to the I frame that caused the reject condition to be initiated.

As with the other supervisory responses, the P/F bit may be used in the REJ frame.

Unnumbered_Type_Frames

Unnumbered frame control fields are either commands or responses. This standard follows X.25 as much as possible. The only deviation from X.25 is in the addition of the Unnumbered Information (UI) frame from ADCCP. X.25 is designed to work with in full-duplex systems with only one main device (DCE) and potentially many users (DTEs).

Amateur Radio packet systems differ greatly on both of these respects. Not only is Amateur Radio packet networking done in a half-duplex rf environment, but many DCE/DTE links many be sharing the same channel. Many amateurs have rejected the use of X.25 as a result of these problems. X.25 can easily be enhanced so that it will perform properly over amateur radio.

Fig. 8 shows the layout of U frames implemented within this standard.

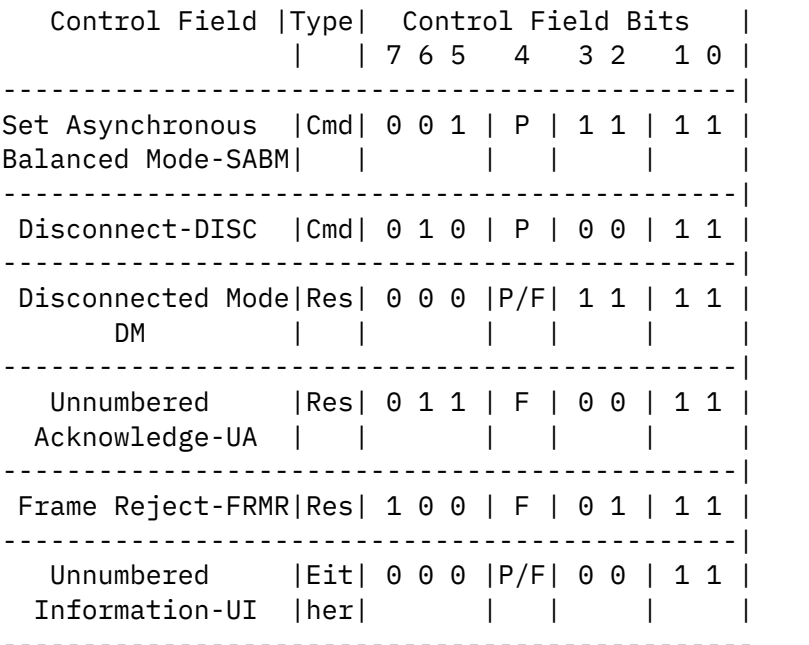

Fig. 8. U Frame Control Fields

Set_Asynchronous_Balanced_Mode_(SABM)_Command

The SABM command is used to place 2 stations in the asynchronous balanced mode. This is a balanced mode of operation known as LAP B where DCEs and DTEs are treated as equals.

Information fields aren't allowed in SABM commands. Any outstanding I frames left when the SABM command is issued will remain unacknowledged.

Disconnect_(DISC)_Command

The DISC command is used to terminate a link session between two stations. No information field is permitted in a DISC command frame. Any outstanding I frames will remain outstanding.

Disconnected_Mode_(DM)_Response

The disconnected mode response is sent whenever the DTE or DCE receives a frame other than a SABM while in a disconnected mode. It is sent to request a set mode command, or to indicate it cannot accept a connection at the moment. The DM response cannot have an information field.

A DCE or DTE in the disconnected mode will respond to any command other than a SABM with a DM response with the P/F bit set to 1.

Unnumbered_Acknowledge_(UA)_Response

The UA response frame is sent to acknowledge the reception and acceptance of a U frame command. A received command is not actually processed until the UA response frame is sent. An information field is not permitted in a UA frame.

Frame_Reject_(FRMR)_Response

The FRMR response frame is sent to report that for some reason the receiver of a command or information frame cannot successfully process that frame and that the error condition is not correctable by sending the offending frame again. Typically this condition will appear when a frame without an FCS error has been received with one of the following conditions:

1. The reception of an invalid or not implemented command or response frame.

2. The reception of an I frame whose information field exceeds the agreed upon length.

3. The reception of an improper N(R). This usually happens when the N(R) frame has already been sent and acknowldeged, or when N(R) is out of sequence with what was expected.

4. The reception of a frame with an information field where one is not allowed, or the reception of an U or S frame whose length is incorrect.

When a CMDR or FRMR frame is sent, an information field is added to the frame that helps to explain where the problem occurred. This information field is three octets long and its contents is shown if Fig. 9 below.

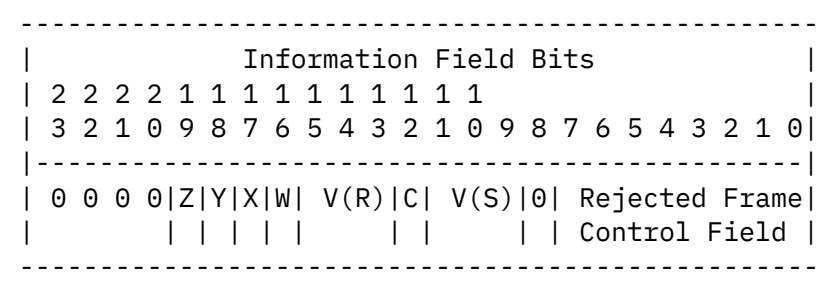

Fig. 9. FRMR Frame Information Field

Where:

1. The rejected frame control field carries the control field of the frame that caused the reject condition. It is in bits 1-8 of the information field.

2. V(S) is the current send state variable of the device reporting the rejection (bit 10 is the low bit).

3. V(R) is the current receive state variable of the device reporting rejection (bit 14 is the low bit).

4. If W is set to 1, the control field received was invalid or not implemented.

5. If X is set to 1, the frame that caused the reject condition was considered invalid because it was a U or S frame that had an information field that is not allowed. Bit W must be set to 1 in addition to the X bit.

6. If Y is set to 1, the information field of a received frame exceeded the maximum capacity of the device reporting the condition.

7. If Z is set to 1, the control field received and returned in bits 1 to 8 contained an invalid N(R).

8. Bits 8, and 20 to 23 are set to 0. Bit 12 is set to 0 if the rejected frame was a command, or 1 if if it was a response.

Unnumbered_Information_(UI)_Frame

The unnumbered information frame is used to pass information along the link outside the normal information controls. This allows information fields to go back and forth on the link bypassing flow control. Since these frames are NOT acknowledgeable, if one gets wiped out, there is no way to recover it.

The UI frame is not defined in X.25. It has been taken from ADCCP to allow uncontrolled information to flow thru the link without interfering with a next higher layer.

Link_Error_Recovery

There are several link-level errors that are recoverable without tearing down the connection. These error situations may occur as a result of malfunctions within the DTE or DCE, or if transmission errors occur.

Invalid_Frame_or_FCS_Error

If an invalid frame is received, or a frame is received with an FCS error, that frame will be discarded with no action taken.

Device_Busy_Condition

When a DTE or DCE becomes temporarily busy, such as when receive buffers are full, it will send a receive not ready (RNR) frame. This tells the other side of the link that the device cannot handle any more I frames at the moment. This condition is usually cleared by the sending of a UA, RR, REJ, or SABM command frame.

Send_Sequence_Number_Error

If the send sequence number , N(S), of an otherwise error-free received I frame does not match the receive state variable, V(R), a send sequence error has occured, and the information field will be discarded. The receiver will not acknowledge this frame, or any other I frames until N(S) matches V(R).

The control field of the erroneous I frame(s) will be accepted so that link supervisory functions can still be performed, such as checking the P/F bit. Because of this updating, the re-transmitted I frame may have an updated P bit and N(R).

Reject_(REJ)_Error_Recovery

REJ is used to request a retransmission of I frames following the detection of a sequence error. Only one outstanding reject condition is allowed at a time. This condition is cleared when the requested I frame has been received.

A device receiving the REJ command will clear the error by sending over the I frame indicated in N(R) of of the REJ command frame.

Time-out_Error_Recovery

When a transmission abnormality wipes out a single I frame, or the last I frame of a group, there is no way of telling this immediately, since the receiver does not necessarily know something was sent until another frame is sent resulting in an out-of-sequence error. To cope with this situation better, some form of time-out delay will be incorporated by the sender after it sends out a frame. This time-out timer is started at the time a frame is sent, and stopped by the reception of an acknowledgement for the sent frame. If the timer times out before an acknowledgement is received, any unacknowledged frames are retransmitted. The delay is an agreed-upon amount that will vary with the type of rf medium and signaling speed used.

Rejection_Error

A rejection error condition occurs when an error-free received frame has one of the following problems:

1. An invalid command or response control field.

2. An invalid frame format.

3. An Invalid N(R).

4. An information field that exceeds the maximum the device can accept.

Once a rejection error occurs, no more I frames are accepted (with the exception of the P/F bit still usable) until the error is resolved. The error condition is reported to the other side of the link by sending a FRMR response frame.

Primary/Secondary_versus_Balanced_Operation

There are two basic classes of link-level connections. The first, known as Link Access Procedure (or LAP) is often called an unbalanced service where the DCE is considered the primary (or master) devices and the DTEs are considered secondary (or slave) devices. The second class of service is known as LAPB, Link Access Procedure Balanced. In this service both devices are

treated as equals as far as connection requests and other types of commands. There is still only one DCE and potentially many DTEs, but both ends can command the link equally.

Primary/Secondary_(LAP)_Operation

LAP is the older style of link control, where most of the intelligence was assumed to be in a large mainframe (the DCE) and the end users were just using smart terminals (the DTEs). Since network software can have a lot of overhead, it made sense at the time to put most of the overhead in the big computer, and just enough smarts to make the link work in the terminals.

Balanced_(LAPB)_Operation

LAPB is a slightly modified version of LAP. It has been changed to allow the two sides of a link to operate in a more balanced manner. In the official version of X.25 there is still only one DCE to potentially many DTEs, but the two can operate more as equals than master and slave.

LAPB is what this document describes for use over Amateur Radio packet networks. Even when there is a network controller overseeing the network operation, the balanced link procedure will enhance operation.

Connection_Operation

In amateur radio network operations, it would be very helpful if one level 2 protocol would work with the various rf systems in use. An example of this is the difference in operation between a simple two-station link, and multiple stations operating thru a network controller. Obviously, when a network controller exists, it should be considered the DCE, while the other stations connecting to it would be the DTEs. A simple two-station connection is another matter. To this type of connection the station requesting a connection should always be considered the DTE, while the device that is receiving the connection request should operate as the DCE. This simple rule should eliminate any ambiguity that might otherwise occur under these conditions.

NOTE There are a couple minor changes from the official X.25 standard in the protocol recommended here. These changes are done only as abso-

lutely necessary to work over the shared rf media. Since X.25 was written to work so that one DCE talked with many DTEs over a closed network, it cannot properly cope with a channel where there may be many DCEs linked to many DTEs. Some amateurs have thrown X.25 out because of this problem. It seems to take just a couple minor changes in the initial link set-up procedure to make X.25 work properly over amateur radio. Where these changes are made, both the original X.25 procedure and the recommended amateur procedure will be noted.

LAPB_Procedures

The following describes the procedures used to set-up, use, and disconnect a balanced link between a DTE and DCE. These procedures have been taken from X.25 and conform very closely to that standard, except where it was necessary to change due to the radio enviroment.

Address_Field_Operation

All transmitted frames shall have address fields conforming to above-mentioned rules. All frames should have both the destination device and the source device addresses in the address field, with the destination address coming first. This will allow many links to share the same rf channel. The destination address is always the address of the station(s) to receive the frame, while the source address contains the address of the dveice that sent the frame. The destination address can be a group name or club call however, if point to multi-point operation is allowed. This will be discussed further under link operations.

LAPB_Connection_Establishment

When a device (either a DCE or DTE) wishes to connect to another device, it will send a SABM command frame to that device and start a time-out timer (T1). If the other device is there and able to connect, it will answer with a UA response frame and at the same time reset both of it's internal state variables (V(S) and V(R)). The reception of the UA response frame at the other end will cause the device requesting the connection to abort the T1 timer and set its internal state variables to 0 also.

If the other device doesn't respond before T1 times out, the device requesting the connection will re-send the SABM frame, and start T1 running again. This trying to establish a connection will continue until the requesting device has tried unsuccessfully a number of times. That number (N1) is variable, depending on the frequency of operation, type of transmission (eg. terrestial vs. satellite), and the signaling speed in use. N1 will be discussed in another section.

Information_Transfer

Once a connection has been established as outlined above, both devices are able to accept I, S, and U frames.

Sending_of_I_Frames

Whenever a station has an I frame to transmit, it will send the I frame with N(S) of the control field equal to it's current send state variable V(S). Once the I frame is sent, the send state variable is incremented by one.

The station should not transmit any more I frames if it's send state variable equals the last received N(R) from the other side of the link plus seven. If it were to send more I frames, the flow control window would be exceeded and errors could result.

If a device is in a busy condition, it may still send I frames as long as the other device is not also busy.

If a device is in the frame-rejection mode, it will stop sending I frames.

Receiving_I_Frames

If a device receives a valid I frame (one with a correct FCS and whose send sequence number equals the receiver's receive state variable) and is not in the busy condition, it will accept the received I frame, increment it's receive state variable, and act in one of the following manner:

1. If it has an I frame to send, that I frame may be sent with the transmitted N(R) equal to it's receive state variable V(R) (thus acknowledging the

received frame. Alternately, the device may send an RR frame with N(R) equal to V(R), and then send the I frame.

2. If there are no outstanding I frames, the receiving device will send an RR frame with N(R) equal to V(R).

If the device is in a busy condition, it may ignore any received I frames without reporting this condition other than repeating the indication of the busy condition.

If a busy condition exists, the station receiving the busy condition indication should poll the sender of the busy indication periodically until the busy condition disappears.

The reception of I frames that contain zero length information fields shall be reported to the next level but no information field will be transferred.

When an I frame is received with a correct FCS, but it's send sequence number does not match the current receiver's receive state variable, the frame should be discarded and a REJ frame should be sent with a receive sequence number equal to one higher (modulo 8) than the last correctly received I frame . Any out-of-sequence received I frames should be handled in this manner. The received state variable and poll bit in such a discarded frame should be checked before throwing it away, and take any action needed depending on the condition of them.

Receiving_Acknowledgement

Whenever an I or S frame is correctly received, even in a busy condition, the N(R) of the received frame should be checked to see if it includes an acknowldegment of outstanding sent I frames. The T1 timer should be reset if the received frame actually acknowledges previously unacknowledged frames. If the T1 timer is reset, and there are still some frames that have been sent that are not acknowledged, T1 should be started again. If the T1 timer runs out before an acknowledgement is received, the device should proceed to the retransmission procedure.

Receiving_Reject

Upon receiving a REJ frame, the transmitting station will set its send state variable to the same value are the REJ frames received sequence number in the control field. The device will then retransmit any I frame(s) outstanding at the next available opportunity conforming to the following:

1. If the device is not transmitting at the time, and the channel is open, the device may commence to retransmit the I frame(s) immediately.

2. If the device is operating on a full duplex channel transmittiong a U or S frame when it receives a REJ frame, it may finish sending the U or S frame and then retransmit the I frame(s).

3. If the device is operating in a full duplex channel transmitting another I frame when it receives a REJ frame, it may abort the I frame it was sending and start retransmission of the requested I frames immediately.

4. The device may send just the one I frame outstanding, or it may send more than one if any more I frames followed the first one not acknowledged, provided the total to be sent does not exceed the flow control window (7 frames).

If the device recives a REJ frame with the poll bit set, it should respond with either an RR or RNR frame with the final bit set before retransmitting the outstanding I frame(s).

Receiving_an_RNR_Frame

Whenever a device receives an RNR frame, it may transmit or retransmit the I frame whose send sequence number equals that of the received sequence number indicated in the RNR control field. If timer T1 runs out after the RNR was received, the waiting acknowledgement procedure listed below should be performed. The poll bit may be used in conjunction with S frames to test for a change in the condition of the busied out station. No I frames other than the one mentioned above may be sent out before the busy condition is cleared.

Sending_a_Busy_Indication

Whenever a device enters a busy condition, it will indicate this by sending an RNR response at the next opportunity. While the device is in the busy condition, it may receive and process S frames, and if a received S frame has the P bit set to one, the device should send a RNR frame with the F bit set to one at the next possible opportunity. To clear the busy condition, the device should send either a RR or REJ frame with the received sequence number equal to the current receive state variable, depending on whether the last received I frame was properly received or not.

Waiting_Acknowledgement

The device should maintain an internal retransmission count variable which is set to zero whenever another I frame is acknowledged (either thru the reception of a UA or RNR frame, or when a received I or S frame has an N(R) higher than the last received N(R), showing the acknowledgement of additional I frames).

Any time the timer T1 runs out, the device will re-enter the timer recovery condition, the retransmission count variable will be incremented by one, and another internal variable (X) will be set to the current send state variable value.

The device will then restart the T1 timer, set its receive state variable to the last receive sequence number, and retransmit the corresponding I or S frame with the P bit set to one.

The timer recovery condition is cleared when the device receives a valid S frame with the F bit set to one.

If the device receives an S frame with the F bit set to one and N(R) within the range from the current send state variable to X mentioned above inclusive while in the timer recovery condition, this condition will be cleared, and the send state variable will be set to the N(R) received.

If the device receives an S frame with the F bit set to zero but otherwise the same condition as the last paragraph, the timer recovery condition will NOT be cleared. The re-

ceived N(R) may be used however to update the send state variable. The device may keep the last I frame transmitted (even if it was acknowledged) to be retransmitted with the P bit set to one if timer T1 expires at a later time.

Once the retransmission count variable reaches N2, the device should proceed to the resetting procedures outlined below.

Link_Disconnection

When in the information-transfer phase, either device may initiate a link disconnection by sending a DISC frame. It should then start its T1 timer, and wait for a response. If the proper response doesn't come before T1 times out, it should send the DISC frame again and restart T1. If this happens N2 times, the device should enter the disconnected state.

When a DISC frame is received, the receiver should return a UA response frame, and enter the disconnected state.

Disconnected_State

After having sent a DISC frame and received a UA, or receiving a DISC and having sent a UA, the device will enter the disconnected state.

In the disconnected state, the device may initiate a link set-up as outlined in connection establishment above. It may also respond to the reception of a SABM and establish a connection, or it may ignore the SABM and send a DM instead.

Any station receiving a DISC command while in the disconnected state should send back a DM response frame.

Any device receiving a command frame other than a SABM or UI frame with the P bit set to one should respond with a DM frame with the F bit set to one. The offending frame should also be ignored.

When the device enters the disconnected state after an error condition or if it has recovered from an internal error condition by coming up in the disconnected state, it should indicate

this by sending a DM response rather than a DISC frame. It should start the T1 timer when the DM is sent, and if T1 times out before getting a SABM or DISC frame back, it should send another DM frame, and restart T1. After retransmitting the DM frame N2 times, the device will remain in the disconnected state, and no other action will be taken.

Resetting_Procedure

The resetting procedure is used to initialize both directions of flow after a non-recoverable error has occured. This resetting procedure is only used when in the information transfer phase of an AX.25 link.

A device shall request a reset by sending an SABM frame. Upon receiving an SABM frame from a station previously connected to, the receiver of an SABM frame should send a UA frame back at the earliest opportunity. Both devices should then set their send and receive state variables to zero. Any busy condition that previously existed will also be cleared.

It is possible to initiate a disconnect procedure instead of resetting the link.

One device may ask the other to reset the link by sending a DM response frame. After the DM frame is sent, the sending device will then enter the disconnected state.

One device may ask the other to initiate a link reset by transmitting a FRMR response frame.

After sending the FRMR frame, The sending device will enter the frame reject state. This condition is cleared when the device that sent the FRMR frame receives an SABM or DISC command, or a DM response frame. Any other command received while the device is in the frame reject state will cause another FRMR to be sent out with the same information field as originally sent.

The device that sent the FRMR frame should start the T1 timer when the FRMR is sent. If above mentioned frames are not received before the timer runs out, the FRMR frame should be retransmitted, and the T1 timer restarted as des-

cribed in the waiting acknowledgement section above. If the FRMR is sent N2 times without success, the link should be reset.

Rejection_Conditions

A device should initiate the link-reset procedure when a frame is received with the correct FCS and address field during the information transfer phase with one or more of the following conditions:

1. The frame is not known as a command or response to the device.

2. The information field is invalid (as an example is longer than 256 octets).

A device will initiate a reset procedure whenever it receives a DM or FRMR response frame during the information transfer phase.

A device may initiate a reset procedure also whenever it receives a UA response frame or if it receives an unsolicited response frame with the F bit set to one.

Collision_Recovery

Collisions_in_a_Half-Duplex_Enviroment

Collisions of frames of any type in a half-duplex enviroment are essentially taken care of by the retry nature of the T1 timer and retransmission count variable. No other special action needs to be taken.

Collisions_in_a_Full-Duplex_Enviroment

Collisions in a full-duplex enviroment are not really frame collisions, but have more to do with the devices being pulled in two different directions at the same time.

Collisions_of_Unnumbered_Commands

If the sent and received U command frames are the same, both devices should send a UA response at the earliest opportunity, and both devices should enter the indicates state.

If the sent and received U commands are different, both devices should enter the discon-

nected state, and transmit a DM frame at the earliest opportunity.

Collision_of_a_DM_with_a_SABM_or_DISC

When an unsolicited DM response frame is sent, a collision between it and a SABM or DISC may occur. In order to prevent this DM from being misinterpreted, all unsolicited DM frames should be transmitted with the F bit set to zero. All SABM and DISC frames should be sent with the P bit set to one, so there isn't any confusion when a DM frame is received.

Connectionless_Operation

In Amateur Radio circles, there is a type of operation that isn't really feasable using level 2 connections. This operation is the roundtable, where several amateurs may be engaged in one conversation. The only way to accomplish this in a connected mode would be to have everyone cross-connected with each other. This would require a seperate frame to be sent to each member of the roundtable every time someone says something. Obviously, this mode is not practical. The way most amateur packet radio enthusiasts have ended up implementing the roundtable operation is outside the AX.25 connection, but still using the AX.25 frame structure. AX.25 does allow a special frame for this operation, called the Unnumbered Information (UI) frame. It is recommended that when this type of operation is in use, the destination address have a code word installed in it to prevent the users of that particular roundtable from seeing all frames going thru the shared RF medium. An example of this is if a group of amateurs are in a roundtable discussion about packet radio, they could put PACKET in the destination address, so they would only receive frames from others in the same discussion. An added advantage of the use of AX.25 in this manner is that the source of each frame is in the source address sub-field, so software could be written to automatically display who is making what comments.

Admittedly, this is a kludge to the level 2 AX.25 protocol. THis type of operation really belongs at the next layer (layer 3, packet level) of operation, but until layer 3 is implemented, this appears to be an acceptable substitute.

Keep in mind that this mode is connection-

less, so all transmitted frames should be of good quality, as there will be no requests for retransmissions of bad frames. Collisions will also occur, with the potential of losing the frames that collided.

List_of_System_Defined_Parameters

Timers

It is recommended that there are two timers used to maintain the integrity of the AX.25 layer 2 connection.

The first timer, T1, is used to make sure a device doesn't wait forever for a response to a frame it sends. This timer cannot be expressed in absolute time, since the time required to send frames varies greatly with the baud rate used at level 1. T1 should be at least twice the time it would take to send a maximum length frame to the other end of the link, and get the proper response frame back from the other end of the link. This would allow time for the other end of the link to do some processing before responding.

The second timer, T2, is used whenever T1 isn't running to make sure that a supervisory frame is sent periodically to maintain link integrity. It also will vary dramatically depending on layer 1 constraints, and is subject for further study.

Maximum_Number_of_Retrys_(N2)

The maximum number of retrys is used in conjunction with the T1 timer. It will vary depending on the layer 1 in use, but will generally be sixteen.

Maximum_Number_of_Octets_in_an_I_Field_(N1)

The maximum number of octets allowed in the I field will be 256. There should also be an even multiple number of octets.

Maximum_Number_of_I_Frames_Outstanding_(k)

The maximum number of outstanding I frames at a time is seven. A smaller number may be used at any time, provided it is agreed upon ahead of time.

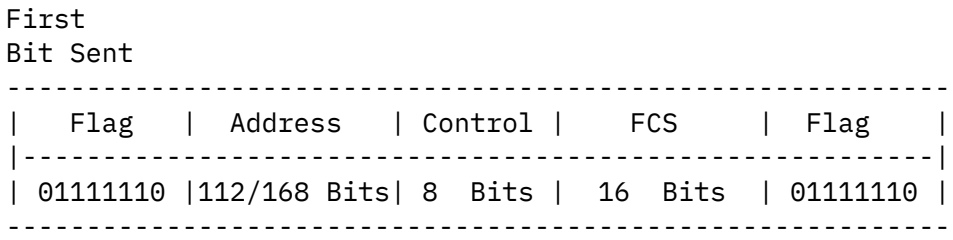

Figure 1A. U and S Frame Construction

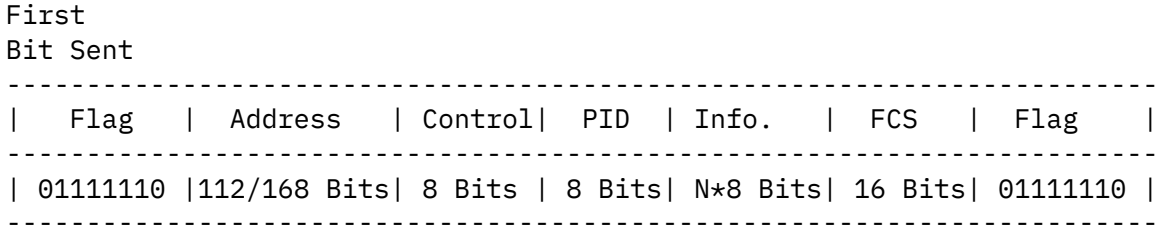

Figure 1B. Information Frame Construction

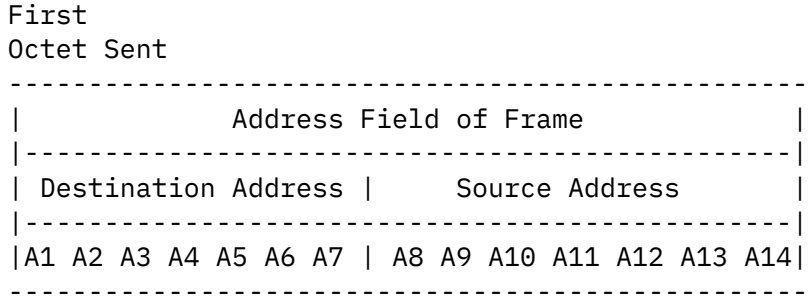

Figure 2A. Non-Repeater Address Field Encoding

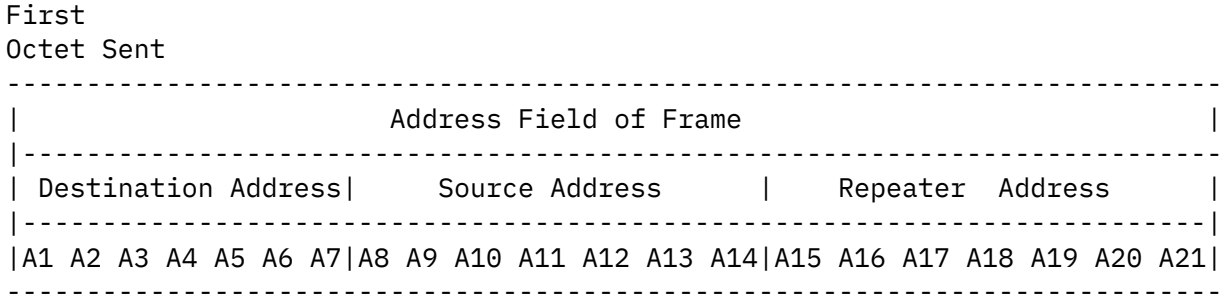

Figure 2B. Repeater Address Field Encoding

Appendix A. Non-Repeater Frame Example

A18	J	10010100	94
A19	F	10001100	8C
A20	I	10010010	92
A21	SSID	11100011	E3
Control	SABM	00111111	3F
PID	none	11110000	F0
FCS	part 1	XXXXXXXX	HH
FCS	part 2	XXXXXXXX	HH
Flag		01111110	7E

The above frame is the same as in Appendix A, but with the addition of a repeater address sub-field (WB4JFI, SSID=1). The H bit is set, indicating this is from the output of the repeater.

Appendix C.
Advantages of the WB4JFI Addressing Scheme

Some of the advantages to using this addressing system are:

1. Every packet station will have a unique fixed address that doesn't change every time a new network is logged into.

2. Relocating to a new area won't cause major (or minor) problems.

3. Allows for more than 62 or 31 users at a time.

4. No local packet guru is needed to assign addresses with attendant concerns of backup and transfer during failure.

5. Direct or network operation requires no change of address.

6. All the problems with dynamic allocation/de-allocation are eliminated.

7. Reduces local co-network interference due to users in overlapping local network rf

domains with the same address fields.

8. With every frame having both the destination and source addresses in them, it will be a lot easier to set-up and run multiple connections on the same data channel without having problems arise as to who is sending what frames to whom.

9. In round-table operation, every frame sent will have the source address imbedded in it, allowing automatic printing of the source of the frame.

Appendix D. Layer 2 AX.25 State Table

I have been wondering about the process of learning "morse" code, and whether it may require some associative processing in the human mind. By this I mean likening it more to language learning than to factual or procedural learning, as the technical aspects of the ham examinations require. Is this why the code is more difficult for certain of the (clearly) competent folks who would otherwise have their tickets today? (That these individuals have highly developed the other side of their brains, possibly at the expense of the artistic, ... associative halves?).

How could we measure this in a straw poll? (how many hams vs aspiring hams enjoy classical music?).

In reply to other letters, I believe that I, as a ham, am indeed afraid of CB-style invasion of the ham bands. I am frankly embarrased by listening to 2-Meters, and would have little sense of loss by abandoning the upper 1 Mhz to experimenters, existing BS artists and possible CB types. If there were a class or even a separate service for experimenters, and GOOD work were being done there, I would probably take that exam in addition to my Advanced ticket. I just fear that the new service could degenerate and cost the hams some really good spectrum, though I doubt that it could get too much worse than 2-meters, and that the CW requirement would not prevent that from happening.

There are at least 7-10 really different specialties in ham radio now, (CW, traffic, DX, VHF FM, EME, satellite, etc) and so long as the implicit band plans are protected by the new class of license, I have little fear of allocating some spectrum to the experimenters, on a shared basis (making experimenters a new class of the same service).

I think that the hams also have some esprit de corps concerning quality of the service, and the traditions/obligations concerning Public service and advancement of the state of the art. If the incoming hams, whether Novice, Tech .... or experimenter, recognize this and acknowledge the charter of the service, I think there is room for them.

I say this as a reversal of my previous position, and with reservations. I pray that the FCC will act wisely, and that the existing ham population will think carefully and act wisely following whatever the FCC does.

73's and long live ALL forms of ham radio (I love CW)...Chris WD5IBS

I recently purchased an Icom 4AT (3/26/83), and am curious
if there are any control links from the bay area of calif.,
to the chicago-land area via the 70cm band .
I am only interested in link's that may be public knowledge
since I am not a member of any system yet. The only one I
am aware of is something that will get me on 29.600 Mhz.
Any ideas ?
Thankyou,
William Artelt   Ampex Corp. Redwood City, Ca.

NOTE:
CW is *almost exclusively* used on UHF and above for DX attempts,

NOT as rare as one may think. This whole argument seems pretty juvenile. Granted there are a lot better ways of communicating than Morse Code, however no one says you have to use it, only learn it. A similar argument would be, "I don't need to learn addition to use Calculus." I didn't know there were so many experts out there that can't comprehend a simple "language" that a lot of grade schoolers and Boy Scouts easily become proficient at with minimal effort.

UNIVERSITY OF SURREY, GUILDFORD, SURREY, ENGLAND
****

UOSAT SPACECRAFT OPERATIONAL STATUS:
****

**** UOSAT BULLETIN-19   1200 GMT   30 MARCH 1983 ****

** S/C NEWS **

FURTHER COMMAND STATION FACILITIES HAVE BEEN DEVELOPED TO SUPPORT ATTITUDE MANOEUVRES DESIGNED TO ATTEMPT TO FREE THE SNAGGED TIP-MASS MAGNETOMETER CABLES BASED ON THE RELATIONSHIP BETWEEN THE SCIENTIFIC AND NAVIGATION MAGNETOMETER DATA AND THE CHANGE IN DYNAMICS OF THE SPACECRAFT COMPOSITE DUE TO CURRENT BOOM DEPLOYMENT.

IT IS NOT KNOWN WHETHER IT WILL BE POSSIBLE TO CLEAR THE CABLE PROBLEM, HOWEVER, IF AFTER ALL ATTEMPTS HAVE BEEN MADE WE ARE UNSUCCESSFUL, ALL IS NOT LOST AS THE SPACECRAFT CAN BE EITHER SPIN STABILISED OR MAGNETICALLY STABILISED OR, POSSIBLY, QUASI-GRAVITY GRADIENT STABILISED USING CONTINUOUS ON-BOARD

COMPUTER ATTITUDE CONTROL. IT WILL TAKE A NUMBER OF WEEKS TO EXHAUST ALL CABLE RECOVERY POSSIBILITIES.

** S/C ATTITUDE **

THE SPACECRAFT IS CURRENTLY SPIN STABILISED WITH A SPIN PERIOD OF 30 SECS.

** S/C OPERATIONS SCHEDULE **

WED 30 MARCH - MON 4 APRIL.....1200/SPEECH TELEMETRY/BULLETIN

TUES 5 APRIL - THU 7 APRIL.....300 BD ASCII / RTTY TELEMETRY

CURRENT OPERATIONAL CONDITIONS SHOULD INCREASE 145MHZ AVAILABILITY DURING WEEKDAYS. NEW SOFTWARE IS UNDER TEST WHICH WILL INCREASE THE RELIABILITY OF LOADING OF THE WEEKEND BULLETIN PROGRAMS. SUGGESTIONS FOR NEW PRESENTATION FORMATS FOR THESE WOULD BE WELCOME.

** THANKS FOR FEEDBACK **

K1KSY,B.LINDHOLM,WA2LQQ,W4AUZ,JA4GVA,WD4IXI,HB9RKR,HB9RJV,VE2QO

** POST BOX **

**K1KSY DE G3YJO...THANKS FOR DATA AND PLOTS RECEIVED, VERY GOOD.

**WA2LQQ DE G3YJO..DOES THE US NEED ANY MORE COPIES OF THE IERE UOSAT JOURNAL, G3AAJ COULD CARRY IN MAY.

HAPPY EASTER FROM THE UOSAT TEAM

Received: Tue Apr 5 05:57:09 1983

Amateur radio station W5RRR, Johnson Space Center, Houston, has again been granted temporary authorization to rebroadcast shuttle transmissions. Approximate frequencies are 3905, 7230, 14280, 21375, and 28600 mHz. CW may also be used for contacting W5RRR 25-30 kHz up from the bottom of each band. An attractive QSL card will be available.

Subject: ham radio on Challenger?
X-Google-Info: Converted from the original B-News header
Posted: Tue Apr 5 08:24:57 1983
Received: Wed Apr 6 02:18:35 1983

I've heard various reports (rumors) that one of the Challenger shuttle crew is an amateur radio operator and that he will have a radio (2 meter) with him to make contacts as time permits.

Can anyone confirm or dispute this? More specifically, if it is true, can anyone suggest a frequency he might be on?

Any info would be helpful.

Thanks, John Burgess, N7DCQ

Shuttle audio relay via W5RRR is on one or more of the following
frequencies:

3905 - 7230 - 14280 - 21375 - 28600

The station will be active 1100 - 1300 CST and 1600 - ? CST daily and
starting at 0700 CST on Saturday.

Thursday's EVA prep starts at 1009 CST with EVA from 1515 - 1845 CST.
TV downlinks scheduled for 1532, 1707 and 1842 CST.

I've got an old (1946) National HRO-5 receiver which I have recently

replaced with a newer receiver.

My question is: is the HRO-5 worth keeping, or should I sell it?
What is a good selling price for a 50 lb. radio that makes you unplug
coils if you want to change bands? Is it an antique?

_S_p_r_a_t_l_y__I_s_l_a_n_d_s_. DJ6SI and DF3NG left Singapore on the third and expect to be active as 1S1SI and 1S3NG on the eighth.

_C_h_a_t_h_a_m__I_s_l_a_n_d_. Ron, ZL1AMO/c, expects to be active through the tenth. He operates mostly cw but does get on ssb occasionally. Look for Ron at 2300Z on 28025 or 28505 kHz, at 0000Z on 21025 or 21295 kHz, at 0330Z on 14025 kHz and at 0500Z on 7005 kHz. He listens on 3505 kHz at 0600, 1000, 1100 and 1200Z but reports very little activity there.

_C_o_n_g_r_a_t_u_l_a_t_i_o_n_s_. Congratulations to DX Bulletin contributor Jim Dionne, K1MEM, and Genevieve, N1CPC, on their wedding this weekend. Their Caribbean trip may include some hamming from VP2EEM and K1MEM/PJ7.

_C_a_m_e_r_o_o_n_. TJ1GH has been active on 21292 kHz at 2000Z on a list by W3WGS. QSL to Henning via DJ5RT.

_T_a_i_w_a_n_. BV2A has been quite active, showing up on the Family Hour on 21345 kHz at 2330Z.

_N_i_g_e_r_i_a_. KC7UU/5N6 is very active and expects to be on sstv and rtty in the next few months. He is also working toward possible summer trips to 5U and TT8.

_T_a_n_z_a_n_i_a_. Tom, 5H3TL, can be found on 14260 kHz at 0345Z and on 21292 kHz at 1800Z. QSLs go to K8ZH.

_I_T_U_. A Vienna station signing 4U1VIC has been worked on 21310 kHz at 1415Z. QSLs go via the OE3 bureau.

_R_o_d_r_i_g_u_e_s__I_s_l_a_n_d_. K1BJ/3B9 has been worked on 21035 kHz at 1200Z. QSL to his home QTH.

_M_a_r_i_a_n_a_s_. K00TT/KH0 is active on 14030 kHz at 1345Z. QSL to his home call.

_M_a_l_i_. F6FIC/TZ was worked last weekend on 21335 kHz at 1700Z.

_M_a_l_a_w_i_. 7Q7LW was also worked last weekend on the Africaner Net on 21355 kHz at 1800Z.

_H_e_a_r_d__a_n_d__W_o_r_k_e_d_. 9V1TL 21026 kHz at 1430Z. OY7ML 14026 kHz at 1800Z. FP8HL 14028 kHz at 1400Z. ZK1CG 21345 kHz at 1330Z. 7P8CI 21340 kHz at 1800Z.

qst de ad7i
holmdel, new jersey, u.s.a.
hr propagation forecast bulletin nr 15   from arrl headquarters
newington ct april 11, 1983
to all radio amateurs bt

on april 8 the solar flux curve rose above the line for the previous

solar rotation for the first time since march 23. the solar flux
high thus far in april is only 106, but the current appearance of the
sun shows more active areas than at any time since the middle of
march.   this trend should continue for about ten days, but no major
rise is expected.

geomagnetic activity has been at intermediate levels so far in april,
making for propagation quality generally below normal for this time
of year. some improvement is likely april 12 through 15 and 18
through 20. mild disturbances will occur intermittently much as they
have in recent weeks. the poorest conditions are expected around
april 16 and 22.

the generally lower levels of solar activity and the change to spring
connditions will mean reduced hours of dx on 21 and 28 mhz except for
the lower latitudes and on north south paths. the effects of the
combined solar and seasonal decline are clearly apparent in the
propagation charts shown in qst for april, pages 64 and 65.

american sunspot numbers for march 31 through april 6 were between 28
and 57 with a mean of 46.9 ar

I'm looking for an article that had appeared in either 73 or QST magazine a few years ago. The article was about MDS television (the microwave band 1.9 gHz to 2.3 gHz. In that article was plans on how to build a low cost down-converter for that band. I am interested in building a 10-15db low noise amp. that I can put before my down-converter and I believe that there were plans for one in that article. What I primarily need is the schematic and board layout. I currently have a down-converter that is pulling in a signal from 43 miles away (very snowy) and would like to boost the signal before I down-convert. I admit that I am not a ham, some of you may flame on that, but I would appreciate any help that I can get. Please respond via Mail to:

_S_p_r_a_t_l_y_. As of 1615Z April 14, there has been no official information on the status of the DJ6SI group.

_M_a_u_r_i_t_a_n_i_a_. Look for 5T5RY around 14200 kHz at 1030Z. QSLs go via F6FNU.

_T_r_i_n_d_a_d_e_. PY1EFM/PY0T may be found on 21335 kHz at 1900Z and on 21280 kHz at 2100Z.

_M_a_l_p_e_l_o__I_s_l_a_n_d_. An operation is expected in June in conjunction with the 50th anniversary of amateur radio in Colombia.

_G_u_a_n_t_a_n_a_m_o_. KG4DX and KG4AW are both very active around 14210 kHz at 1100Z. Also look for KG4AW on 21280 kHz at 1700Z.

_S_u_d_a_n_. DF3NZ/ST2 is on near 3777 kHz at 0300Z.

_S_r_i__L_a_n_k_a_. Look for 4S7EA long path at 1100Z on 14200 kHz.

_M_a_l_d_i_v_e_s_. 8Q7AV is also coming through long path near 14200 kHz at 1100Z.

_C_h_i_n_a_. Tom, VE7BC, reports that a new Chinese station is all ready to go as soon as coax is installed.

_M_a_r_i_o_n__I_s_l_a_n_d_. The crew for the coming year is leaving today and there are no hams included, so ZS2MI will be inactive for at least a year.

_S_t_.__M_a_r_t_i_n_. K1MEM/PJ7 has been operating from the PJ7UQ QTH.

_S_a_n__M_a_r_i_n_o_. The headquarters station of ARRSM will operate as T70/A from 1300Z April 20 to 1300Z April 21. QSL to ARRSM, P. O. Box 1, San Marino 47031.

holmdel, new jersey, u.s.a.
hr propagation forecast bulletin nr 16 from arrl headquarters
newington ct april 18, 1983
to all radio amateurs bt

after three weeks of the lowest solar activity in five years, the
solar flux is rising slightly again. it reached 113 on the 17th and
should go somewhat higher before turning down again in a few days.
geomagnetik activity was lower as this bulletin was issued, so
somewhat better conditions and slightly higher muf can be expected
about april 20.

higher geomagnetic activity is due briefly around april 21, and over
a longer period beginning about the 24th. this will degrade
conditions on all dx frequencies. propagation will improve near the
end of april, carrying over into early may, mostly on low latitude
and transequatorial circuits.

high latitude f layer dx is about over on 28 mhz until autumn, but
increased e layer ionization will produce short skip on 28 and 50
mhz, mostly at distances of 500 to 1200 miles. multiple hop effects
will be more common in july, increasing the communications range to
2500 miles or more. at the height of the e layer season there will
be skip propagation even on 144 mhz at times, notably in june and
july.

american sunspot numbers for april 7 through 13 were between 58 and
67 with a mean of 61.9 ar

hr arrl bulletin nr 6 from arrl headquarters
newington ct january 12, 1983
to all radio amateurs bt

amateurs are reminded that the arrl national traffic system can
handle international traffic, with countries with which such traffic
is permitted, via a special liaison schedule with the international
assistance and traffic net. such traffic at any level of the system
should be routed to the eastern area net, ean, cycle four session,
where it will be dispatched to the designated liaison station.
before entering any international traffic into the system, check the
latest list of third party agreements on page 96 of november 1982

Yes, those that say "CQ" on a repeater are usually scorned as
"newcomers", even though the usage is entirely correct.

I avoid the issue by saying something informal like "KA9Q listening.

Anybody around?"

Phil

Socially Unacceptable ?? ... Well thats the way it seems ...
In many parts of the country (although I understand not so
in the Deep South and Hawaii) it is totally unacceptable
to call CQ thru a 2M repeater. And because of the local
feeling I don't call CQ thru the repeaters. BUT WHY!!

I am not advocating calling long CQs on a repeater, anyone
there is going to hear you the first time. It seems to
make more sense, typical calls or "monitoring" or "listening"
really don't say I am on the air and want to talk to any
other station. And surely a QRZ doesn't fit on a repeater
that has been stone quiet. A simple   N9DRR CQ seems to
fill the bill, and is consistant with all other amateur
operations.

So lets drop the stigma surrounding calling a simple CQ
on the 2M repeaters ... Discussion is welcomed, pure
flaming will be routinely ignored.   73's
                    Steve N9DRR

_Q_a_t_a_r_. Look for Lloyd and Iris from W6KG/A7. QSL via Yasme.

_S_o_u_t_h__S_h_e_t_l_a_n_d_s_. LU3ZI is now active. QSL via LU2A. Another operation is planned for February 6 through 9 as LU1ZC. QSL to LU2CN.

_S_o_u_t_h__O_r_k_n_e_y_s_. VP8AOB can be found around 14240 kHz at 0300Z. LU5ZA should be active until February 16. QSL to LU2A.

_C_h_i_n_a_. A third Chinese and second Beijing station, BY1QH, is expected soon. BY8AA has been very active recently from 0100 to 0300Z around 14048 to 14050 kHz.

_T_r_i_n_i_d_a_d_e_. PY0/TA is expected to be on again in February, hopefully for a longer period of time this trip.

_H_o_n_g__K_o_n_g_. VS6DO may be on Saturday night at 0100Z on 14220 kHz. VP8XAB has been very active on both phone and cw. Watch 14015 kHz at 0230Z for cw and 14220 kHz at 0100Z for ssb.

_H_e_a_r_d__I_s_l_a_n_d_. The VK0/HI gang left Kerguelen at 0100Z this morning and hope to land in three days. They hope to be set up and ready for action by the 24th. The VK9NS group has left Albany and hopes to arrive in 14 to 16 days.

_C_h_a_d_. WB4ZNH, Carl, and WN4FVU, Martha, hope to be on from TT8 tonight if their license arrives in time. Otherwise, they expect to be active on Monday.

hr arrl bulletin nr 8 from arrl headquarters
newington ct january 20, 1983
to all radio amateurs bt

at a public meeting held january 20, fcc adopted a notice of proposed rulemaking on the volunteer exam program in response to arrls petition. fcc also adopted an nprm on the subject of a no code license. arrl believes this nprm will offer two alternatives. one would remove the code requirement for the technician license with privileges limited to frequencies above 50 mhz. the other would be a digitally oriented license. please note that these are proposals only, with the texts expected to be released in early february. details will appear in the arrl letter and qst ar

I am a new ham, mainly interested in digital communications, though I suppose I wouldn't mind ragchewing, if it were about rigs or computers. Despite Novice standing, I plan to upgrade quickly, and I have a severely limited budget. With this in mind, I have several questions...

1. Digital communications take place mainly on VHF, so I'm told.

What frequencies ? What modems/format/protocol ? (At least here in Chicagoland...)

2. Why are there no multiband VHF/UHF rigs - in the same way that MF/HF rigs are multiband (reminder, 160m = MF)? If I can afford only one rig, I'd like it to cover all frequencies of interest to me, so I'm not left out when a new (scarce) digital source goes on the air. One rig for 160m-10m and another for 6m, 2m, 220, 440 - pretty neat idea I think. Sure it'd be twice as expensive as a monoband rig - but it would cover four bands ! Or even three bands would be an alternative...

3. Why are there so few 220 rigs advertised in QST and '73 ? It seems that every 2m rig has a 440 counterpart, but no 220 ! Just the ICOM 3A(T). I'm confused, especially since I'm told that 220 is a popular choice for digital (2m is too crowded, 440 is too costly and lagging in power/propagation). Where are you 220 guys ? Stand up, please !

4. I have 2 Hy-Gain CB boards, and have read that 10 meter AM is alive. I listen on the club rig and don't hear much. Why ? (time-of-day = noon, maybe that's why). It seems to me that a $ 7.00 rig and a homebrew linear (oh, 40 watts or so...) would be a very popular, LOW COST way to get on the air. Articles, anyone (I have only a few)? What bandplan for 10m AM ? Any personal experiences on the net about converting the Hy-Gain board: what am I getting into ?

5. Also, why 10 FM ? Is it really worth the extra hassle to convert to FM? If so, why don't I hear ANY activity at all here ? Even so, there are only a few channels reserved by agreement, doesn't seem like much of a choice...

6. Commercial FM broadcasters use stacked circularly-polarized bays to increase low-angle radiation (hence their ERP), and maintain omnidirectional coverage. Why are there only vertical omni's and horizontal beams in the ham world ? Is no one interested in gain AND omni coverage ?

7. Where can I see HF antenna types rated together for performance, directionality, gain, cost, etc ?

How about some Elmers to the rescue...

Out of habit and convention I usually key up a machine and state that
I am "listening" or "monitoring." However, I have no objection to
a *SHORT* CQ on the repeater. Let's just not make it a 3x3 repeated
X number of times. A simple "CQ BARS, this is KA9MNK" will suffice.

73,
John KA9MNK

Sure, let's call CQ on the repeaters.
Besides, if you really want a QSO, calling CQ is probably the best way to get one. I'll bet that nine times out of ten, some guy who wouldn't bother coming back to a `monitoring' announcement WILL reply to your CQ, simply to flame on about not calling CQ on a repeater, and to `straighten out' the newcomer.

When I have the urge to call CQ on a 2M repeater, I usually say:
"Is anyone around? WB7EEL" or something on the order. I have yet to
receive a complaint. My only objection to someone who would say
"CQ from ax1e"* would be the fact that "CQ" belongs to CW, and the more
informal nature of 2M makes the terse "CQ" rather silly.

John Woods WB7EEL/1, ...!genradbo!mitccc!jfw

*apologies to the hypothetical AX1E, the visual pun was too tempting.

qst de ad7i
red bank, new jersey, u.s.a.
hr propagation forecast bulletin nr 4 from arrl headquarters
newington ct january 24, 1983
to all radio amateurs bt

the solar flux rise reported last week was minimal. after reaching
145 on the 16th, the flux slid to a low of 117 on the 22nd. it rose
slightly the next day, but the appearance of the sun gives little
indication of significant upward movement in the next few days.

geomagnetic activity went through a broad peak just after the middle
of the month, but it was falling again and propagation was improving
at bulletin time. prospects are for a minor disturbance peak about
the 25th, followed by improved conditions through the rest of the
forecast week.

qst propagation charts for late january show a slight increase in the
number of hours available for east west work on the higher
frequencies despite the anticipated drop in solar activity and
sunspot numbers. this is the expected result of increasing hours of
northern hemisphere daylight at this season. the decline in solar
activity has brought the solar flux down nearer to the base numbers
used for the charts, making for improved accuracy on most paths
through at least february.

american sunspot numbers for jan 13 through 19 ranged between 80 and
103, with a mean of 90.7 ar

This weekends contests include

Novice Roundup (see article 347)

ARRL Midnight Special

Contest Period: 0400Z to 0600Z Jan 30. First hour 40 cw, second hour 80 cw

Frequencies: 7040 to 7075 and 3540 to 3575

Exchange: HONEST signal reports (aka, not all 599's, HI) and a three letter
          abbreviation for the name of your county. Work stations once per
          band. NO AMPLIFIERS!!!

CQWW 160 Meter CW Contest

Contest Period: 2200Z Jan 28 until 1600Z Jan 30. CW only

Exchange: Signal report and QTH (state/province for W/VE stations, country for
           others.
Frequencies: 160 Meters, of course, but stay out of the 1825 to 1830 Khz cw
              DX window!!

French CW Contest

Contest Period: 0600Z Jan 29 until 1800Z Jan. 30

Exchange: Signal report and Serial No.. French Stations will also send
           a two digit Department (county) number.

harpo!Anonymous   Jan 28 16:19:00 1983

I've written a fortran 77 program to
determine the VUCC Grid Location
given latitude and longitude.

Example: 40d 46.9m N 74d 41.4m W = FN20ps

See QST, Jan 83, "VHF/UHF Century Club",
by W1XX, page 49.   The definitions
given for the 1st, 2nd, 5th and 6th
characters are mathematically incomplete.
I had to call ARRL to find unambiguous
descriptions.

The program is a bit long to put
out on the net unless there is
sufficient interest. (About 100 lines,
about half comments)
If anyone is interested I can
send them a copy from whuxb.
The links for mail, usend, uucp, etc. to/from
the new gummo unix seem to be gummed up.

Having finally upgraded my Novice, I've been looking at HTs.
The best two look to be the TR-2500 and the latest Santec
(I forget the model number). Nobody around here uses the
Santec - does anybody out there in netland? Why don't people
buy from Santec? Please respond - the Santec looks to me like
the better HT, but I don't want to get stuck with a radio that
can't get repaired, or something.
     Thanx and 73s,
          David Kaufman, KA1AGE (Interim New York)

Subject: Ariane L-6 Delayed
X-Google-Info: Converted from the original B-News header
Posted: Thu Jan 27 02:18:39 1983
Received: Sun Jan 30 03:43:55 1983

The following is quoted from Aviation Week and Space Technology, Jan 17, 1982,
page 27.

"Sixth flight of Europe's Ariane launcher is facing possible new delays as
program personnel work on third-stage engine modifications and ground
verification checks required after the failure of Ariane 5 last September
(AW&ST Sept. 20 1982, p. 20). The sixth flight is now expected in May or
June, although a firm date will not be set until after review meetings.
The launch had been planned for November, 1982, but was pushed back to the
second half of April after the No. 5 Ariane's failure (AW&ST Nov. 1, 1982,
p. 24)."

Note that this launch is the one scheduled to carry Amsat Phase-3B in a
dual-payload carrier along with the primary payload, ECS-1.

Yes folks, Its Novice Roundup time, one of the few, if not the
only, contest designed for Novice and HF Technician activity.

Object: For Novice and Techs to work as many stations on the HF Novice
         Tech bands as possible. Others work Novices and Techs only.

Contest Period: First week of February, Including both weekends. Begins
         0000 UTC Saturday, Jan 29 and ends 2359 UTC Sunday, February 6.
         Operate no more than 30 Hours.

Exchange: Signal report and ARRL section or country for DX stations. Novice
      should sign /N and Techs /T to indicate license class

I have acquired a large quantity of fresh Eveready 186 batteries. They
were shipped from Union Carbide the first week of January, 1983.

They are approximately .455Diax.125L and are manganese dioxide system-
1.5volts. They are suitable for use in calculators, portable radio
receivers, and in battery backup of small or CMOS memories.

In factory bulk pack, 0 per hundred, less than dealer cost.
Distributor net price is $.62, and price breaks are generally not
available in any quantity below 5000 pcs.

I believe I have just found a new use for CW.

I just got one of those junk phone calls in which a "computer"
(tape recorder) calls you up and spits out questions, followed by
prompts for answers.

Well, I faithfully listened to each question and answered each one
truthfully - in CW, using the touch tone dial!

I have not yet received another call.

This weekend's contests include:

NOVICE ROUND-UP:

Continues this week, through Sunday, Feb. 6 at 2359Z

ARIZONA QSO PARTY

>From 1800Z Feb. 5 until 0600Z Feb. 6.

Exchange signal report and QTH (county for AZ stations; state, province, or country for others. Work stations once per band.

Frequencies: phone 3895, 7230, 14280, 21365, 28560
              cw 60 KHz up from lower band edge
              novice 25 KHz up from lower band edge

QRP SSB CONTEST

>From 1500Z Feb. 5 until 1500Z Feb. 6

Exchange signal report, using maximum of 10 Watts PEP output.

NEW HAMPSHIRE QSO PARTY

>From 1900Z Feb. 5 until 0700Z Feb. 6 and 1400Z Feb. 6 until 0700Z Feb. 7

Exchange signal report and QTH (county for NH stations, ARRL section or country for others. Work stations once per band and mode.

Frequencies: phone 3935, 3975, 7235, 14280, 21380, 28575, 50115, 145015
              cw 1810 and 55 KHz up from lower band edge
              novice 30 KHz up from lower band edge

SOUTH CAROLINA QSO PARTY

>From 1800Z Feb. 5 until 2359 Z Feb. 6

Exchange signal report and QTH (county for SC stations; state, province, or country for others. Work stations once per band and mode.

Frequencies:: phone 3895, 7230, 14280, 21365, 28560
               cw 60 KHz up from lower band edge
               novice 25 KHz up from lower band edge

UOSAT SPACECRAFT CONTROL CENTRE
UNIVERSITY OF SURREY, GUILDFORD, SURREY, ENGLAND
****

UOSAT SPACECRAFT OPERATIONAL STATUS:
****

**** UOSAT BULLETIN-13 1200 GMT 28 JANUARY 1983 ****

** S/C NEWS **

THE 2.4 GHZ AND 10.5 GHZ BEACONS ON UOSAT WERE ACTIVATED ON ORBITS 6920 AND 6996 WHEN TELEMETRY INDICATED BOTH BEACONS TO BE OPERATING CORRECTLY WITH 100 MW OUTPUT ON 2.4 GHZ. ATTEMPTS TO TRACK THE 2.4 GHZ BEACON BEFORE STABILISATION IS COMPLETE MAY FOLLOW IF THE ATTITUDE MANOEUVRES SCHEDULE ALLOWS.

THERE HAVE BEEN FURTHER TESTS ON THE CCD EXPT IN PREPARATION FOR POST-STABILISATION OPERATIONS. CCD EXPT OPERATION WAS NOMINAL AND RESULTS WILL BE GIVEN WHEN ANALYSIS IS COMPLETE.

A COMPLETE LIST OF TELEMETRY CALIBRATION EQUATIONS, INCLUDING UPDATES, WILL BE INCLUDED IN A BULLETIN SOON.....WATCH THIS SPACE!

** S/C ATTITUDE **

FURTHER ATTITUDE MANOEUVRES TO TILT THE S/C UP INTO THE ORBIT PLANE IN PREPARATION FOR BOOM DEPLOYMENT HAVE CONTINUED THIS WEEK, INCLUDING CHANGES TO THE Z-SPIN PERIOD, CURRENTLY 50 SECS AT 47 DEGREES. WE HOPE TO BE THERE SOON!!

** S/C OPERATIONS SCHEDULE **

MONDAY TO FRIDAY......ATTITUDE CONTROL & SYSTEM TESTS (INC CCD)

SATURDAY & SUNDAY.....TELEMETRY, BULLETIN & SPEECH TELEMETRY

********** THE 145 MHZ BEACON WILL BE OFF FROM 1200 GMT SUNDAY 30/1/83 FOR ESSENTIAL ATTITUDE MANOEUVRES USING 435 MHZ BEACON **********

IF ALL GOES WELL, THE TIP-MASS RELEASE PYROS ARE SCHEDULED TO BE FIRED ON ORBIT 7316 FOLLOWED BY RECALIBRATION OF THE MAGNETOMETERS.

** THANKS FOR FEEDBACK **

G3LYP, G8UYB, HP1AC, G8EDG, K4GFG, DB2OS, G3YMC, WD4IXI, JH7CKF, AMSAT-UK-523, AMSAT-LM-728, SM7AIO, HP1AC, WA5ZIB, G3UYB, G4ROA, SM7-6859, JA4GVA, OZ1WN.

POST BOX

*** JR1SWB DE G3YJO, TNX FOR LETTER 11/1/83 WILL ADVISE WHEN VISIT POSSIBLE.

*** QSL CARDS WILL BE SENT TO ALL STATIONS SUPPLYING REPORTS SHORTLY.

Subject: TAPR board information & availability
X-Google-Info: Converted from the original B-News header
Posted: Tue Feb 1 00:24:08 1983
Received: Wed Feb 2 02:52:52 1983

I just had a telephone conversation with Den Connors, KD2S/7, the president of TAPR. Den gave me some tentative information that would be of interest to those of you who would like to obtain packet radio boards.

At this point, TAPR is busily assembling, testing, and is about to ship 200 "beta" version packet radio boards. These are going to members of TAPR who agreed to be test users. Part of the reason that beta site users are required to be members is legal: if TAPR were to sell complete units to the "general public", they would have been required to meet the Part 15 Class B RFI limits and submit a unit with a $2000 testing fee to the FCC lab for verification. On the other hand, a kit is not subject to the requirements.

The TAPR board of directors is meeting this Saturday to decide how to further distribute the boards past the beta test. At this point, the possible alternatives are as follows:

1. A blank board for $40.

2. A board and a kit of parts for $250. This would consist of a board with the discrete parts and IC sockets wavesoldered on by a professional PC board house. The ICs supplied would be tested. All you would have to do is plug in the ICs. This is as far as they can go without having to pay the $2000 testing fee (but of course you take responsibility for meeting those requirements, just as with any personal computer.)

3. Same as #2, but including a custom cabinet, $300.

TAPR is likely to decide to go with only two of these three alternatives; further information will be forthcoming as it comes.

For those interested in further information or in joining TAPR, here's their mailing address. One year's membership is $12.

to all radio amateurs bt

the fcc has authorized the use of the amtor digital teleprinter code
by radio amateurs in the hf bands. amtor is a handshaking digital
teleprinter technique which is immune to fading, interference and
receiver tuning errors. see june 1981 qst, page 25, for details on
amtor.   this fcc action will be effective upon publication in the
federal register ar

hr arrl bulletin nr 11 from arrl headquarters
newington ct february 1, 1983
to all radio amateurs bt

the fcc has released the notice of proposed rulemaking proposing to
establish an amateur radio operator license class which would not
require any demonstrated ability to send or receive morse code. the

so called codeless license proposal seeks to create one of two possible new classes of amateur license. one alternative would be the technician class without the five word per minute morse code examination. this license would carry all amateur privileges above 50 mhz. the second alternative would be an experimenter class. this license would require passing a theory test which would require knowledge of digital and other amateur techniques and would grant all amateur privileges above 144 mhz. fcc seeks comments on this proposal, especially views on the composition of the new theory test for the proposed experimenter class. it also seeks comments on the frequency privileges to be given to either a codeless technician or experimenter class. comment deadline is april 29, 1983. replies are due may 31. march 1983 qst will carry the entire text of this proposal, including information on how to file comments with the fcc. the docket number is 83 28 ar

I have acquired a large quantity of fresh Eveready 186 batteries. They were shipped from Union Carbide the first week of January, 1983.

They are approximately .455Diax.125L and are manganese dioxide system-1.5volts. They are suitable for use in calculators, portable radio receivers, and in battery backup of small or CMOS memories.

In factory bulk pack, $30 per hundred, less than dealer cost. Distributor net price is $.62, and price breaks are generally not available in any quantity below 5000 pcs.

UOSAT SPACECRAFT OPERATIONAL STATUS:
****

**** UOSAT BULLETIN-14 1200 GMT 4 FEBRUARY 1983 ****

** SPACECRAFT NEWS **

THE BOOM TIP-MASS RELEASE PYROTECHNIC PIN-PULLERS WERE FIRED SUCCESSFULLY ON ORBIT 7127 FOLLOWING A LAST MINUTE SOFTWARE HOLD ON ORBIT 7126. DETAILED ANALYSIS OF REAL-TIME TELEMETRY AND STORED MAGNETOMETER DATA HAVE CONFIRMED THERE TO HAVE BEEN NO PERTURBATION TO EITHER THE S/C ATTITUDE NOR THE MAGNETOMETER ALIGNMENT.

** SPACECRAFT ATTITUDE **

ATTITUDE MANOEUVRES HAVE CONTINUED THIS WEEK, INCLUDING CHANGES TO THE Z-SPIN PERIOD, CURRENTLY 70 SECS AT 60 DEGREES TILT. WE HAVE NOW ENTERED THE REGION OF POTENTIAL GRAVITY GRADIENT CAPTURE. MANOEUVRES TO INCREASE THE TILT AND REDUCE THE SPIN FURTHER WILL CONTINUE NEXT WEEK IN PREPARATION FOR BOOM DEPLOYMENT.

** SPACECRAFT OPERATIONS SCHEDULE **

MONDAY TO FRIDAY......ATTITUDE CONTROL & DEPLOYMENT SOFTWARE TESTS

SATURDAY & SUNDAY.....TELEMETRY, BULLETIN & SPEECH TELEMETRY

** THANKS FOR FEEDBACK **

_H_e_a_r_d__I_s_l_a_n_d_. VK0CW has made over 17,000 contacts. Both VK0CW and VK0HI are extremely active on all bands from 80 through 10 meters. Watch 7003 or 7017 kHz at 1800 and 2330Z. QSL to N2DT. Also, VK0NS should be active by the time you read this. This group left Kerguelen Island on Tuesday.

_A_m_s_t_e_r_d_a_m__I_s_l_a_n_d_. FB8ZQ if often around 14025 kHz at 2200Z. Alain is also active on 40 and 80 meters. QSL via F6AJN.

_K_e_r_g_u_e_l_e_n__I_s_l_a_n_d_. FB8XAB can be found on 21-16 kHz at 1500Z and on 14005 kHz around 0100Z. QSL to F6GXB.

_C_h_a_d_. TT8BC said during the recent operation that more activity should be heard from this country in the future. QSLs for TT8BC go to K4PHE and for TT8AC to N4NX.

_S_o_u_t_h__S_h_e_t_l_a_n_d_s_. LU3ZI has been very active on 160 through 10 meter cw. Watch 1829 kHz at 0300 and 0600Z. Operation will continue until February 16.

_S_o_u_t_h__O_r_k_n_e_y_s_. LU5ZA is active on 80 through 10 meters ssb with three or more operators. Look on 7085 kHz at 0600Z and 3740 kHz at 0800Z. CW operation will begin as soon as the keyer is fixed. QSL to LU2A.

_I_n_d_i_a_. VU2BK can be found on 7002 kHz at 2300Z and 3502 kHz from 0000Z.

_P_o_r_t_u_g_a_l_. CT stations are optionally using the prefix CQ through the end of March.

_L_i_b_y_a_. 5A1BQ is apparently a pirate operation. None of the various QSL managers specified know anything about the operation.

_N_i_g_e_r_i_a_. KC7UU/5N6 is very active on 14024 kHz at 0000Z, 21012 kHz at 1300Z, and 7005 kHz at 0200Z.

_Q_a_t_a_r_. A71AD may be found nightly on 3795 kHz. W6KG/A7 can be found on 21022 kHz around 1500Z and on 28501 kHz at 1330Z. Iris and Lloyd will next stop at A9 later this month. They will not be visiting A6.

_U_n_i_t_e_d__A_r_a_b__E_m_i_r_a_t_e_s_. DJ8WL left Wednesday for a two month stay in A6. Peter will try for an authorized operation.

Subject: RS Satellite News
X-Google-Info: Converted from the original B-News header
Posted: Mon Feb 7 23:31:05 1983
Received: Wed Feb 9 05:44:24 1983

The following is courtesy of K1HTV, VP Operations for AMSAT:

Here are some notes on some of the presently operating Radio Amateur satellites.

The RS5 telemetry beacon (29.452 MHz) was heard today (Feb 7) in the dwell mode, sending a series of either "E01" or "EG01". This is normally the battery voltage telem. channel and a reading of 01 translates to a dead battery. The RS-5 satellte however is far from dead and seems to be operating properly, even in darkness so the meaning of the 01 raw data on channel "E" and "EG" is unclear. Maybe it has something to do with the codestore message mentioned later in this text.

Although the R5-5 transponder has been comanded off, three channels have been operational, the 29.452 MHz telem. beacon, the 29.350 MHz service channel which retransmits CW on 145.850 MHz, and the ROBOT-Codestore channel on 29.330 MHz. This latter channel is presently being used by a Soviet Antarctic expedition whose communications group is headed by Leo Labutin, 4K1CR (UA3CR), whose picture recently appeared in ASR #50. Because of the unreliable HF propagation between the Antarctic and the U.S.S.R. , the expedition is using the store and forward (codestore) capability of RS-5 to exchange messages between the Soviet Antarctic base(s) and Moscow.

On Monday, February 7th the following message was copied around 21:30 UTC from the RS-5 beacon on 29.330 MHz.

"UA3AJH UW3CX SRO(OE)NO [OE sent as one letter sounds like cheh] DAJTE SEANSY KOSPASA QTH NEOBHODIMO OTMETITX KARTE ULETAM 10 FEW DE 4K1CR 4VUV ".

Aquick call to Dex Anderson, W4KM, provided the following translation of the above Russian message to English. It says UA3AJH UW3CX (in Moscow), URGENTLY GIVE (us) PASSES (orbital info) on KOSPASA . It is NECESSARY TO NOTE the QTH ON MAP.

FLY OUT on FEB 10 . FROM 4K1CR (call sign of Leo, UA3CR).

The KOSPASA mentioned in the above message refers to the Soviet KOSPAS search and rescue satellite which was launched on June 30, 1982 as part of a joint international effort by the United States, the U.S.S.R., France and Canada. KOSPAS and SARSAT satellites are to be used to locate downed civil aircraft and ships. The first rescue mission occured on Sept.10, 1982 when a downed Canadian plane was found using the Soviet KOSPAS satellite.

>From the message one can speculate that the reason for the Antarctic expedition wanting the orbital data for the KOSPAS satellite is that they are going to do some transmitting on one of the ELT (Emergency Locating Transmitter) frequencies to test the bird. The results should indicate on the map just where on the Antarctic continent the Soviet base is located.

The last part of Leo's message mentions TO FLY OUT FEB 10. It is not clear if he means that they will be flying out of their present are to another base or if they will be leaving the Antarctic continent.

Switching to other Soviet birds, RS-6 and RS-8 have had their transponders on lately and have been in favorable positions at times for a number of long haul DX contacts between eastern Europe and the U.S. east coast. In the past week, EQXs were around 30 degrees West longitude and occured about 21:00 UTC. Yours truly, K1HTV, located 12 miles NE of Washington, DC worked YO2IS in Rumania on three different passes as well as a number of Czech stations. Earlier in one of those passes, TU2IE in the Ivory Coast was worked. For those who still need Asia to complete Satellite WAC and don't mind waking up in the middle of the night for an hour or so might I recommend a try with UA0BBN. Mike is on especially on weekends, where he goes begging for contacts at times. He often calls people who call CQ and likes to operate about 20KHz up from the low end of the RS6 & RS8 satellites' passbands . On Feb. 6th UA0BBN and K1HTV worked on 6 different passes of RS6,7 & 8. The QSO via RS7 was via the 145.850 / 29.350 MHz service channel.

On 6 Feb> RS7 was copied dumping a list of stations that had made contact with its onboard ROBOT . Of the 50 call signs dumped, there were stations from all continents except Africa, (but ROBOT did work two stations in Antarctica). I wonder how long it will be before ROBOT gets DXCC.

Reports continue to come in indicating that RS1 and RS2 are both semi-operational. The 29.4 MHz beacon of RS1 can be heard when the bird is in sunlight. The telemetry it sends is not valid and the satellite identifies itself as "55". In fact all letters in the RS1 telemetry are sent as the numeral "5".

A recent report from Europe indicates that RS2 is also active at times, with its transponder occasionally on (and very sensitive) but its 29.4 MHz beacon off. The last report of the RS2 beacon being copied was from W6ELT who in mid January, heard both RS1 with its NG telemetry and RS2 with its good telemetry and its RS RS identifier which indicated that its transponder was ON. Both birds were heard by George within the same hour, about 30 minutes apart between the hours of 5:45 and 6:30 AM PST before local sunrise. So with RS1-8 and U-O-9 it looks like we presently have a total of 9 active (or sem-active) Radio Amateur satellites in orbit.

Now that the First Phone license no longer exists, could anyone tell me what commercial licenses (and endorsements) the Friendly Communications Commission is still issuing and what they're good for? Also, does the FCC publish any kind of study guide or outline? I still see guide books for the First and Second Phone in the stores; would these suffice to study for the General? Which of these study books are the best?

Please reply via mail and I will summarize to the net.

Thanks,
John Opalko

I believe there was a question on how and where to send comments to the FCC. Here is the recommended proceedure:

Comments to the FCC should be on 8 1/2 by 11 inch paper with the left-hand and top margins being at least 1 1/2 inches and at least one inch on the right side and bottom of the page. Use one side of the paper only and double-space your comments, except for long quotations, which may be single spaced. All papers shall be typewritten. Number your paragraphs and in your comments, refer to the docket paragraph number or rules Part number that you are commenting on.

Be polite and don't insult the Commission. Don't say "don't do" something unless you have an alternative to offer.

Mail the original and 5 copies to:

Federal Communications Commission
Mr. William Tricarico, Secretary
1919 M. Street, NW.
Washington, D.C. 20554

The top of the first page should be headed as in the following example:

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, D.C. 20554

In the Matter of	)	
	)	Docket No. 82-83
Notice of Proposed Rulemaking	)	
and Notice of Inquiry regarding	)	
expansion of phone subbands in	)	
the Amateur Radio Service	)	

COMMENTS

On the last page, sign and date your comments:

_H_e_a_r_d__I_s_l_a_n_d_. The VK00JS and VK00NL expedition is now active, as well as the VK00CW and VK00HI group. VK00CW and VK00HI have now made over 23,000 contacts and have been particularly active on 20 meters. VK00JS and VK00NL are also very active on 20 and have made many contacts on 40 meters. Check 7004 kHz at 2200Z.

_N_e_p_a_l_. An operation by a group of JA amateurs signing 9N1WW is expected to begin February 15 and continue for 12 days, followed by three days at S21, Bangladesh. QSLs go to JA8BMK.

_S_o_u_t_h__O_r_k_n_e_y_s_. LU5ZA continues very active on all bands.

_S_o_u_t_h__S_h_e_t_l_a_n_d_. LU3ZI is reported to have left the island.

_G_u_i_n_e_a__B_i_s_s_a_u_. J5HTL has been showing up with the W7PHO Family Hour on 21345 kHz around 0020Z. QSL via SM3CXS.

_B_u_r_u_n_d_i_. There was activity from 9U5JM this past weekend on 21285 kHz at 2015Z. QSL to John via F3LQ.

_F_B_8_. A net activity from 0100 to 0200Z on 14285 kHz includes most of the active FB8 stations, such as FB8WI, FB8WH, FB8XAB, and FB8ZQ.

_T_r_i_n_d_a_d_e_. There is a rumor of an operation beginning on the 17th by PY00TA.

_1_6_0__M_e_t_e_r_s_. Good catches include XT2AW on 1829 kHz at 0600Z, LU5ZA on 1818 kHz at 0600Z, and ZS5LB on 1826 kHz at 0300Z.

_B_e_a_c_o_n_s_. The Northern California DX Foundation worldwide beacon net has added 4X6TU/B and ZS6DN/B to its roster. For information on net operation and listener reports, contact

W6RQ.

_H_e_a_r_d__a_n_d__W_o_r_k_e_d_. 3A2EE 3796 kHz at 0530Z. DU9RG 3795 kHz at 1230Z. AP2KS 3799 kHz at 2210Z. VS5HG 21345 kHz at 0020Z. 9X5MB 21290 kHz at 2045Z. VK6LK and VK6HD 3795 kHz at 2200Z. G4LJF/3V8 28545 kHz at 0025Z.

_R_o_d_r_i_g_u_e_s_. 3B8DA/3B9 can be found on 28550 kHz at 1300Z and around 14215 kHz at 0330Z.

_Z_D_7_,__8_,__a_n_d__9_. ZD7BW, ZD8LM, ZD9BV, ZD9BX, and ZD9YL may all be found on 21335 kHz between 1700 and 1900Z. They are usually on three or four days each week.

_C_e_n_t_r_a_l__A_f_r_i_c_a_n__R_e_p_u_b_l_i_c_. TL8TX plans a long stay. Look for him on 21280 kHz at 1700Z and 28700 kHz at 1300Z.

_S_o_u_t_h_e_r_n__S_u_d_a_n_. 9Y4RD/ST/0 plans a two month operation. Present activity is mainly on 10 and 15 meter ssb.

_M_a_l_a_g_a_s_y_. 5R8AL is back and is active on Monday and Wednesday on 21330 kHz at 1700Z. Look for him also on rtty on 21095 kHz at 1900Z. F6EXV hopes to operate 5R8AL for two weeks in mid-March.

_C_o_m_o_r_o_s_. D68AM is due up on 21285 kHz at 1800Z on Wednesday, February 23.

_U_g_a_n_d_a_. 5X5FS is on 21280 kHz at 1800Z on Fridays and on 28600 kHz at 1700Z on Saturdays. QSL to EI9G.

_I_r_a_q_. YI1BGD may be found on the low end of the 20 meter ssb band around 1500Z on Saturdays.

_S_o_u_t_h__O_r_k_n_e_y_s_. Sunday evenings find VP8AOB on 14220 kHz around 0300Z.

_M_o_r_o_c_c_o_. CN8EU is very active on 21295 kHz at 2200Z. QSL to KA4S.

_M_a_r_c_h__R_u_m_o_r_s_. There may be operations from Clipperton and from Malpelo in March. Details as they develop.

_G_r_a_n_d__T_u_r_k_s_. VP5MOX will be on cw for the contest this weekend and plans ssb operation before and after, through Wednesday.

_1_6_0__M_e_t_e_r_s_. It is reported that W1FC became the first W1 to work Japan on 160. He contacted JA8IEF at 1134Z on the 13th, with signals apparently coming long path.

_B_e_a_c_o_n_s_. The Northern California DX Foundation is seeking volunteers to monitor the Worldwide Beacon Net now partially operational on 14000 kHz. Contact W6RQ for details.

Since Spring is just around the corner I feel that the subject of
safety should be addressed. One area of the hobby can be rather
dangerous if proper and careful planning has not been accomplished,
I'm speaking of antenna installations. Let me relay this story
of a fellow amateur who did not think ahead. This gentleman is
sitting at his desk answering a letter from his insurance company.
  " I am writing in response to your request for additional
information for block number three of the accident reporting form.
I put "poor planning" as the cause of my accident. You said in
your letter that I should explain more fully and I trust the
following detail will be sufficient.
  I am an amateur radio operator and on the day of the accident,
I was working alone on the top section of my new 80 foot tower.

When I had completed my work, I discovered that I had, over the course of several trips up the tower, brought up about 300 pounds of tools and spare hardware. Rather than carry the now un-needed tools and material down by hand, I decided to lower the items down in a small barrel by using a pulley, which fortunately was attached to the gin pole at the top of the tower.

Securing the rope at ground level, I went to the top of the tower and loaded the tools and material into the barrel. Then I went back to the ground and untied the rope, holding it tightly to insure a slow decent of the 300 pounds of tools. You will note in block number eleven of the accident reporting form, that I weigh only 155 pounds.

Due to my surprise of being jerked off the ground so suddenly, I lost my presence of mind and forgot to let go of the rope. Needless to say, I proceeded at a rather rapid rate of speed up the side of the tower. In the vicinity of the 40 foot level, I met the barrel coming down. This explains my fractured skull and broken collarbone. Slowed only slightly, I continued my rapid ascent, not stopping until the fingers of my right hand were two knuckles deep into the pulley.

Fortunately, by this time, I had regained my presence of mind and was able to hold onto the rope in-spite-of my pain. At approximately the same time, however, the barrel of tools hit the ground and the bottom fell out of the barrel. Devoid of the weight of the tools, the barrel now weighed approximately 20 pounds. I refer you again to my weight in block number eleven. As you might imagine, I began a rapid descent down the side of the tower. In the vicinity of the 40 foot level, I met the barrel coming up. This accounts for the two fractured ankles and the lacerations of my legs and lower body.

The encounter with the barrel slowed me enough to lessen my injuries when I fell onto the pile of tools and fortunately, only three vertebrae were cracked. I am sorry to report, however, that as I lay there on the tools, in pain, unable to stand and watching the empty barrel 80 feet above me... I again lost my presence of mind. I let go of the rope."

Some years ago I saw a circuit for a flourescent light inverter
in a magazine. It ran of 12-15 volts, the idea being you could use
it in a camper running of a battery.

I now have the need for such a circuit, but appear to have lost the
mamgazine/photocopy.

I know of other places to get the basic circuit, but what made this
one special, and what I am after, is that it had a dimmer facility.
As you may have noticed, flourescent lights do not dimm just by having
a phase triggered SCR.

Can anybody out there help me ? I would be glad to pay postal
charges for a copy of such a circuit. It does not have to run off
a battery, 110 volts is fine.

_M_o_z_a_m_b_i_q_u_e_. Jack, ON6BC/C9, has appeared from Mozambique as of one week ago and plans to stay through the end of next week. Jack has been worked on 10 through 40 meters, both phone and cw. The DXCC status is yet unconfirmed as ham radio has been disallowed in Mozambique for some years.

_I_n_f_o_r_m_a_l__D_X__N_e_t_. An informal roundtable group has assembled daily at 1700Z on 21335 kHz. Although this is not strictly a DX net, this week there have been appearances by 5X, 3X, 7Q7, TL8, and ZD7, 8, and 9.

_E_a_s_t_e_r__I_s_l_a_n_d_. A new operator, Hector, CE00ERY, has been licensed and stationed on Easter Island. Look around 0330Z on 20 meter ssb. His QSL manager is WB6WOD.

_T_u_r_k_s__a_n_d__C_a_i_c_o_s_. VP5FUX has been active for the ARRL contest and will be active during the 160 meter contest this weekend. QSL Fred via his home call, K9VV. Many other VP5s have been active recently, some plan to stay for the 160 contest also.

_S_t_.__V_i_n_c_e_n_t_. J87LTA, operated by K4LTA, and others is now active on all bands, 160 through 10 meters. The group plans to move to Antigua next week, signing V2AXA.

_C_e_n_t_r_a_l__A_f_r_i_c_a_n__R_e_p_u_b_l_i_c_. TL8DC appears regularly Wednesdays at 1500Z around 28600 kHz.

_1_6_0__C_o_n_t_e_s_t_. Don't forget the CQWW 160 Meter Phone Contest, from 2200Z February 25 to 1600Z February 27.

_U_g_a_n_d_a_. Terry, 5X5FS, has been suddenly active after an absence of many years. Terry signs EI9G in his home country and plans to be active in Uganda for at least a few more weeks. QSL via his home callsign.

_K_e_n_y_a_. Nana, JI1VLV, and a small Japanese group are activating 5Z4NN. This station has been worked on 80 through 10 meters, specifically concentrating on cw. QSL this call via JI1VLV.

_M_a_d_a_g_a_s_c_a_r_. Alain, 5R8AL, is back on the air from Madagascar. Look for him around 1730Z around 21330 kHz.

_F_B_8_. Activity has been at an all time high from FB8W, X, and Z. However, FB8XAB departed on schedule last week for France. Alain, FB8ZQ, is heard daily on 20 meter cw around 0100 until 0145Z.

_S_t_.__P_e_t_e_r__a_n_d__S_t_.__P_a_u_l__R_o_c_k_s_. A German group is scheduled to depart for St. Peter/St. Paul around March 5. They are planning a five or six day operation. More details next week.

_S_v_a_l_b_a_r_d_. JW5AA, operated by Jerry, LA5VAA, is currently active from Bear Island. Although Jerry has been worked and heard on all bands, he prefers 15 meter ssb. QSL via LA4YM.

_A_n_g_u_i_l_l_a_. The group signing VP2E in last week's contest is still active on most bands with various callsigns. Each callsign has a separate QSL manager.

_B_a_h_a_m_a_s_. Gary, K00GVB/C6A, has arrived in the Bahamas for the 160 meter contest this weekend and has been heard testing antennas.

_T_r_i_n_d_a_d_e_. A PY1 station from Brazil is presently active signing /PY00 from Trindade. Although the callsign is unknown, this station has been reported on several occasions over the last few days. It is not known how long this activity will continue.

_A_n_t_a_r_c_t_i_c_a_. The Federal German South Polar Station DP00LEX will be replaced by DP00AA in March.

Have any of you bought ham gear in Japan? I'll be vacationing there shortly.
I know about Akihabara and have been told that "Rocket" is a good store.
I need information about relative prices, duty, export models as opposed to
"made for Japan" models, validity of warranties, and so forth. Thanks.

Morse Code.	)	

COMMENTS

I am overjoyed to see a proposal for a codeless Amateur Radio Operator's License.

I am a computer programmer, 27 years old, with more than 10 years' experience in computers. Two years ago I became heavily involved with the local Amateur Packet Radio group, headed by Hank Magnuski, KA6M. (The group has since become the Pacific Packet Radio Society.) At that time there were about 30 people in the group. I was excited by the idea and the potential of packet radio and was willing to learn and to help it get going.

I started collecting information and equipment. I subscribed to the newsletters of the Vancouver Area Digital Communications Group and the Hamilton (Ont.) packet radio club, and bought the AMRAD Packet Radio Conference proceedings. I bought a 1200 baud modem and a packet radio "terminal node controller" board. I started reading listings of the software that runs in the controller board. I reviewed a Canadian book (from Tab Press) on packet radio.

At the same time, I was attending Packet Radio meetings and meeting many of the hams involved. I discovered that, to connect a radio to my computer and send 1200-baud ASCII computer data over the air, I was required to deal with a Federal agency and to learn an archaic transmission code well enough to decode it in my head "on the fly". I began to see why packet radio was still holding meetings and not building a network.

I'm not sure how familiar you are with the history of the computer industry. I am not the person to teach it, but one thing has been clear to me: Much technological progress has occurred because anyone could attempt to design and build an

improved anything -- hardware, software, communications network, mass storage device, you name it -- and it was NOT controlled by the Government, choked by bureacracy, or shielded by special interest rules and legislation. If I liked ASCII better than EBCDIC for my application, there was nobody who could force me to use EBCDIC. If I found a way to store twice as many bits on a disk, or push twice as many down a local area network cable, the marketplace and my organizational ability would decide whether my invention was worth its salt.

I began to learn about Amateur Radio from the hams around me. Here is what I learned:

* Whether or not I ever USE Morse code, I need to learn it to pass this test. Being able to write a program that can read it off the air and translate to ASCII on my screen is not good enough. The idiot work must be done by a human to be worthwhile.

* If I don't go get a license, but just set up a radio and a modem and start transmitting, I am committing a Federal crime, and there are plenty of old hams who do nothing but sit in their homes and listen for people like me so they can turn me in to the Feds. This is true whether or not I cause any harm or interference to anyone else.

* It's theoretically possible to run our packet radios faster than 1200 baud -- in fact by using telephone style modems we are using a lot more bandwidth than we need -- but it would take a special variance from the FCC even to experiment with it, and there's no guarantee that it would ever be legal for the general public anyway.

* Yes, I could hook up a packet radio to my Computer Bulletin Board System (which had been running for about a year, accepting public telephone calls on my Apple computer to allow people to send and receive messages with each other) and let people send and receive messages over the radio, but there are laws that require me to be there at all times so I can cut them off if they swear or something. (I need a "control operator".) Furthermore, I can't pass "third party traffic" and if someone might use my system instead of making a toll phone call then I am illegally using amateur radio to steal business from the phone company.

* I have some good ideas, but why don't I go get a license and then I'll really have something to say. My opinion is not worth much because my name doesn't have random letters and numbers after it. (This was not true of everyone but was definitely there in some.)

This was daunting, but I still had enough excitement and energy to continue working. (Partly, I couldn't believe things were

really that bad. If I built a packet radio station and got it working and providing a useful service to the Amateur community, nobody would really play straight-and-narrow with the rules, would they?) I bought parts for my Terminal Node Controller board and started to build and debug it -- buying and borrowing tools and equipment, setting up a room in my house for electronics work. I got a copy of the FCC Working Paper on deregulation of Amateur Radio and prayed and tried to get people to read it. I enrolled in the San Francisco Radio Club's class for novices and started to learn radio theory (easy), regulations (rote memorization), and Morse code. I kept going to Packet Radio meetings and eventually ended up on the Steering Committee -- it turned out that since many of the hams there had little computer experience, they'd never been exposed to networking concepts, ideas, or implementations. As a result I was one of the three or four people in the club who could actually UNDERSTAND the protocol being used and the program that implemented it. "They also serve who stand and rag-chew", I guess, but they weren't helping to design the network, which I was.

Alas, my Morse Code classes weren't going very well. They were trying to teach at 15-18 words a minute, so we'd eventually be comfortable at 13 words a minute. It was an effort, and I wasn't interested; I was interested in getting past the regulations so I could start to get some real work done. The radio theory was going fine and there was interesting information there, things that I would need to know. But after a month of two-night-a-week classes, I dropped out. We hadn't even been taught all the letters yet!

I tried to stir up some sentiment in the Packet Radio Society that we should work towards a code-free license, by passing a resolution and sending it to the FCC, ham magazines, etc. The general feeling was that I should get a license first and then they'd think about it.

I tried to find out why people felt so strongly about Morse code. Most of them admitted that they never used it themselves except for I.D.; they all used voice and packet. So what was the fuss? Here were some answers I got. Some were used as arguments, some were told in private by friends, some were figured out by me:

* We had to do it, so you will too. No punk kid is going to get away with getting in easy when I had to pay my dues.

* If we removed the code test, the airwaves would be flooded with trash. It would be just like CB. We've got to hold on to the spctrum space and not let it get crowded or it won't be any good anymore.

* It's not such a big deal, it only took me a week, so

what are you so worried about?

* That's the way it is and you'll understand after you've been in this field as long as I have.

* It's useful in emergencies, you might hear an SOS that nobody else hears and save a life.

* You could transmit using nothing but a rusty spoon and a piece of rock when the earthquake happens and your packet radio is smashed.

* It can get thru many kinds of interference that voice and computer data just can't penetrate.

Some of these need no rebuttal, but others might:

* The airwaves belong to "the public". Hams seem to feel that the airwaves belong to hams -- that it's fine for them to carry around a handy-talky and talk to their friends all day on the repeaters, but for the general public to do that would spoil their game. They aren't advancing the state of the art of radio -- why do they get privileged use of the airwaves?

* If the communications modes in use now are too crowded, the solution is not to create a privileged class -- the solution is to use new modes, such as packet rather than Morse, which allow more people to share the same channels that are now crowded.

* Maybe with the right teacher it IS possible to learn the code in a week. I didn't get that teacher. Mine tried to teach me far more than I wanted to know or needed to know. As a result, I never learned it -- should that be a reason to keep me from advancing the state of the art of radio networking?

* Cardio-Pulmonary Resuscitation and first aid are useful in emergencies too, but not knowing them doesn't keep you from getting a ham radio license. The government can encourage emergency preparedness but to mandate it just means that people who would contribute in other ways won't contribute at all.

* After the earthquake there will be several thousand voice handy-talkies around, as well as good old CB radios. Civilization is not going to disappear from the Earth without killing all the humans too, so building radios from natural raw materials is not going to be a problem.

* Packet radio gear automatically detects garbled transmissions and will retry them without my even noticing most of the time. If packet won't get thru and it's really important, of course, I'll use the telphone. I can always use a program to transmit and receive in Morse when conditions are bad

and the phones are down, if I ever need to -- the same way I'd use a program to talk packets (much faster) under normal conditions.

Meanwhile, back in the hardware lab, the circuit board I was building was giving me problems. I'd tried to replace the memory section with one that only required 5 volts instead of 5, 12, and -5, and had a power supply that was too small for the board. I had managed to burn out 3 or 4 central processor chips and possibly some of the auxiliary chips while debugging. The board worked once in someone else's system but I never got it to work by itself.

Between the lack of support on the code&license question, and the hardware problems, my active interest in packet radio started to dwindle. I kept attending meetings and talking with Hank (KA6M) on the protocol, but eventually sold the circuit board to someone who could debug it, returned the borrowed scope, disassembled the wire-wrapped PROM burner, and went back to working on software. To this day I haven't made an active contribution to the technical art of packet radio -- I've critiqued several designs and offerred suggestions, but I never got the chance to work on the software or hardware to actually implement the designs.

That's where the crying need is now. There are plenty of people who know how to build a radio, put up an antenna, organize a ham society. There are only two people in our group (of about 40, still) who have worked on the software, though -- and they aren't likely to get new recruits who aren't already hams. For someone coming from the free-and-easy world of computers, coping with the attitudes of hams and the bureacracy that governs their behaviour is a serious problem. We and the other packet radio groups would like to build a nationwide network of store-and-forward packet radio repeaters. This requires a lot of work -- much of it organizational, some of it in hardware, and a lot in software.

That's where I can make my contribution -- except there's a whale in the way. You, the FCC, are that whale. When I gave up, I resolved to just sit back and wait until the ham radio situation straightened itself out (if ever) before attempting again to contribute. The current proposal (for a code-free license) is a step in the right direction. If you implement it, I will get a license (although that alone will probably take six months of paper-shuffling) and get some more hardware and go back to trying to do some good for the packet radio world. If not, I'll sit waiting in the wings until some of the old (and young) reactionary hams die off and maybe there is some acceptance of new ideas.

My ultimate fantasy is to see black boxes with an RS232 (serial computer data connector) plug on one end and an antenna on the

other. Anyone could walk into their favorite computer store, Radio Shack, or ham store, and buy one, plug it into their home computer, and be interconnected with the other packet radio users in their city (and thru their city's connection to the packet radio backbone network and packet radio amateur satellites, to all other packet radio sites in the world).

Right now, due to earlier FCC deregulation efforts, that kind of networking is possible with a 300-baud direct-connect telephone modem -- and thousands of people have bought and used them for exactly that (such as with my Apple Bulletin Board System). Curiously enough, visitors from other countries express the same incomprehension at seeing this that hams express at the idea of people just buying a packet radio and turning it on.

The problems with telephone modems are that they are slow and only provide local communication -- nobody can afford to use one for long-distance communication unless they can write it off as a business expense.

Imagine what would occur if you could buy an Atari or Apple or IBM home computer with a communications box -- one that didn't cost $20/hr on the telephone, but still put you in touch with the world. I've been using computer networks for close to 10 years and I have some idea of the amount of information that would be available -- that would make peoples lives and jobs easier -- that would provide conversation and company to people who are feeling alienated -- that would provide a forum for people upset or enraged or interested in a public discussion -- that would bring the Information Age into the homes of the people, not for the benefit of a corporation, not with a monopoly deciding what information would get into the network and who would get it out, but for the benefit of all the people helping each other to build their dreams, share their knowledge and their energies and their pleasures, and live their lives a little closer to the way they want them.

There are people attempting to build the first hardware toward this vision -- the Tucson Amateur Packet Radio Society. (Their box does not include the radio; you have to add a handy-talky.) There are people, of whom I am one, working on and using networking software that connects over four hundred diverse computers around the world into an anarchistic computerized forum -- controlled by no-one, participated in by all. (All messages are transferred over phone lines, and any long-distance calls are paid for by business and University computer budgets.) This network is called the Usenet and much of its software is in the public domain. I and others from the computer field can adapt this, and other, software, and contribute the knowledge of networking required to make it work. There are people who have been trying to design "WorldNet" for years now -- figuring out the software and administrative requirements for a network that anyone could connect to or disconnect from at will, a network

that could handle a million or 100 million users, in their usual state of motion and change, without falling apart. We're professionals who realize the potentials and are afraid that, as in the past, most of the benefits of computer technology will continue to go to businesses and governments, operating to restrain peoples' choices instead of expanding them, giving the public pay-TV, video games, and central control over information distribution, instead of an improved society.

But WorldNet is still a fantasy. Some of the problem is economics -- technology is taking care of that. Most of the rest of the problem is governments. Within the U.S., that means the FCC. Even with a code-free license, a license is still required, classes have to be taken, there's an N-month delay while the bureacracy shuffles your papers. To many people, it's just not worth hassling with -- there are so many other interesting things that they could be doing with their computers -- they'll find another interest. One where they can walk in, buy it, and use it, without asking the government. And those places are where the products will be introduced, where the technical advances and the price reductions will be made, where the public will be served. Not in packet radio or WorldNet. Not unless the regulations get as loose as CB, or looser.

I realize that it takes time to dismantle a legacy of bureacracy, and I've been encouraged in recent years to believe that is the job the FCC has undertaken to do. The code-free license is an important step on that path, and no matter how much it angers the existing special-interest-group (many Amateur Radio Operators), it will be for the ultimate good of the country and will contribute to the world's progress both in the radio art and in the improvement of the general quality of life.

I believe that removing the current Morse code requirement from the Technician Class license is the best way to introduce the code-free license into the existing licensing structure. It significantly reduces the administrative burden on the FCC without significantly altering the requirements of the license or the privileges granted by it, in comparison with the proposed Experimenter Class. It also imposes no new burden on the ARRL volunteer licensing program (except larger volumes of people taking the existing tests, which the ARRL can hardly object to).

I furthermore believe that the frequencies and transmission modes authorized for the codeless license should be the same as those of the current Technician's and General licenses (subject to restrictions imposed by international agreements). I believe that, in general, the introduction of new communications methods into the Amateur service will be hastened by as few restrictions and regulations as possible; a competent Technician should not be required to upgrade her or his license to use a frequency band or a transmission mode which was previously unused for similar methods. In other words, as many possiblilties should

be legalized at once as is possible, to avoid later having to spend time removing restrictions, and to avoid discouraging good new ideas because a long-drawn regulatory process is required to experiment with them. I realize that some areas must be reserved for Advanced and Extra classes as an incentive measure, but this should not be applied such that the set of available frequencies for experimental Technican and General use is too small.

In particular, almost all current Packet Radio work is going on in the 2-meter bands, because equipment is cheap and plentiful. If the 2-meter band was not available, packet development work would have to move to 220 or 440MHz where equipment is costlier. This would also split the existing packet radio groups between old-timers who could continue to use 2 meters, and newcomers who'd be forced into other bands.

I note that the ARRL's editorial against this proposal (March 1983 QST, page 9) never once mentions an argument against the proposal; it simply states that most amateurs oppose it, and rages against the FCC's refusal to obey the ARRL in this important matter. Personally, I'm on your side.

I have enclosed a few comments that were exchanged on the Usenet (the computer network mentioned above) on the subject of code-free licenses. I have also put these comments into the Usenet, and encouraged others to send their own. A few sentences will clear up some terminology problems: Phrases like "decwrl!decvax!harpo!floyd!peri!sbcs!rick" identify the path that the message has taken thru the network, from Rick on machine "sbcs" (SUNY Stony Brook computer science dept.), thru machine "peri", to "floyd", and so on to "decwrl" (Digital Equipment Corp's Western Research Lab). A "flame" is a heated reply; e.g. a response made while annoyed, rather than after deliberation. The enclosed are only a few of the comments that were made on the topic; I started to save them but quickly realized that there were far too many messages to save, so these are only the first few. The last message was sent by me in response to a general "Hey, has anybody used packet radio out there?" query.

In the same issue where the ARRL rages against the FCC's proposal to
create a code-free license (but fails to give any reasons against it,
besides "We don't like it."), there's also a little box on page 57
inviting lawyers who are also hams to help the ARRL "stem the tide of
overly restrictive regulations on Amateur Radio". Also pg. 79's Club
Corner bemoans the lack of young people in ham radio, claiming that they
seem more interested in computers and video games, then goes on to present
recruiting proposals designed to wean the kiddies away to ham radio
instead. It might be easier if you could buy a ham radio and play with
it -- like a computer or video game -- instead of studying and passing
tests first, but somehow this point is missed.

To John Opalko:

Aw, come on, gimme a break! John's comments are precisely the kind of
input the FCC has been looking for from non-hams. I'm sure that John
and others like him would be an asset to amateur radio given the kinds
of activities he's involved in. The least you could do is offer him
some encouragement; I doubt your "comment" would be taken as seriously
as his if you filed it with the Commission.

 ...are a bad idea in my opinion.

Although I think packet radio is perhaps the most interesting new form
of communication that needs encouragement, we shouldn't forget that
plenty of advances can still be made in the more mundane modulation methods.
For this reason, an experimenter needs the maximum freedom in the choice
of modulation, and could very well have good reason to use voice.
For example:

1. Experimentation with high efficiency switcher-modulated linear
   amplifiers, such as those used by necessity on the Oscar satellites.
2. Voice associated with television transmission.
3. Good old on-the-air voice coordination of specialized communications

tests, such as packet radio.

Why should a Experimenter be prohibited from putting up a repeater or sending television or facsimile? Knowledge of the code is certainly no guarantee that someone is competent enough to do so.

No, I don't think code proficiency should be a requirement for anything other than sending CODE (and using the HF bands, according to treaty). If you want to "keep the loonies out" or keep the influx of new amateurs within limits to prevent band crowding, which are both worthwhile considerations, the proper way to do it is by making the theory test sufficiently difficult, not by making the license useless.

I have an Extra Class license to show that I personally did not consider the code requirement as something to be minimally met; however, I fully sympathize with those potential experimenters who consider it superfluous for THEIR interests.

I am beginning to think that the real reason so many amateurs oppose the no-code license is a growing insecurity regarding the prospect of an influx of newcomers who might be more technically competent than themselves. As an emotional defense mechanism, these amateurs hold on to the code requirement to "prove" to themselves and others that they're still superior in some way to the masses. It is time for this attitude to change.

	)	PR Docket No. 83-28
Establishment of a Class of	)	
Amateur Operator License Not	)	
Requiring a Demonstration of	)	
Proficiency in the International	)	
Morse Code.	)	

COMMENTS OF MR. PHILIP KARN, KA9Q

I have been a licensed amateur for over 11 years, almost 10 as an Amateur Extra Class licensee. During this time, I graduated from high school, obtained Bachelor's and Master's degrees in Electrical and Computer Engineering, and obtained a professional position with Bell Telephone Laboratories. I consider the technical knowledge and motivation for learning gained through amateur radio to have been a strong factor in my choice of a career in the communications and computer industry.

During my years as an amateur, although I have contributed to public service activities (e.g., Civil Defense) my primary interests have always been technical: new communications modes, techniques, and higher frequencies. I am currently involved in two new technologies: packet radio and amateur satellites, as an Assistant Vice President for Engineering with the Radio Amateur Satellite Corporation (AMSAT). Because I share the Commission's interest in furthering the state of the art, my comments will deal almost exclusively with this potential of a code free license.

As one who has both professional and amateur interests in communications, I am constantly struck by the contrast between the people in my two environments. On the one hand, a disturbingly large fraction of radio amateurs with access to the spectrum appear relatively uninterested in advancing the state of the art. On the other, many of my colleagues have a personal interest in radio communications. While they certainly have the capability to make significant contributions to low-cost implementations of advanced technologies, they are barred from doing so by even the 5 wpm code requirement associated with the Technician Class license.

I have often tried to encourage interested colleagues to obtain amateur licenses. The replies are often along these lines:

1. "I don't need or want to learn the code; I just want to experiment with packet radio". [or, satellites, microwaves, etc]
2. "Why should I want to be part of a service that's snobbish enough to insist that everyone learn the code?"
3. "Nobody does anything technically innovative in the Amateur Service. I wouldn't have anybody to work with."

These three reasons reinforce each other. Opportunities for innovation are often missed because many "technical types" aren't hams. They resist what they perceive as an arbitrary requirement kept in place by an elite group more intent on maintaining their "exclusive rights" than in advancing the state of the art. While I point out that CW is still a useful mode in many situations, even in advanced systems such as OSCAR satellites, I cannot help but agree that the code should not be a mandatory entrance requirement.

I therefore strongly support the Commission's desire to create a form of "code free" license, fully aware that the majority of my fellow amateurs disagree with this position. My only concerns are practical: while there is general agreement that the "microwave bands" (1215 Mhz and up) could easily support many more amateurs, it is not as clear with regard to the 50-450 Mhz bands.

For this reason, I feel that if the Commission adopts any code-free proposal, it should also do the following to alleviate congestion if at all possible:

1. Grant no new services access to the 220 Mhz band.
2. Maintain the use of 420-430 Mhz by the Amateur Service.
3. Expedite the allocation of additional VHF/UHF spectrum to the Amateur Service, particularly the 902 Mhz WARC-79 band.

Even with additional VHF/UHF frequencies, simply removing the code test from the Technician license would likely result in severe overcrowding on the popular 144 Mhz band. Overcrowding, such as that in Southern California, not a lack of code proficiency, is the major cause of accidental and intentional interference. It therefore unfortunately becomes necessary to limit access to 144 Mhz, but I cannot justify the code requirement on its own merits for that band any more than I can for the less crowded higher frequencies.

The best way to limit crowding on 144 Mhz while still encouraging talented newcomers and the use of the higher amateur bands would be with two types of code free license. The lower grade would require only the theory test associated with the Technician license and provide all privileges on 220 Mhz and up. The higher grade would grant all privileges above 50 Mhz to licensees who demonstrate a knowledge of theory equivalent to that required of Advanced or Extra Class licensees.

While a "digital" specialty license would undoubtedly appeal to a number of potential amateurs, I feel that it would be too restrictive. Such a license would ignore the needs of potential amateurs interested in other areas, such as microwaves and satellites, and isolate those who do obtain the "digital" license from the rest of the amateur community.

It is good to see all the docket comments and ideas posted here on the net. It is an excellent way to get numerous ideas on how to write one's own comments. I also appreciate the various bulletins that appear here. They are immensly useful for distributing on our local 2 meter nets.

One thing that comes to mind concerning the no-code license. I notice that some propose no voice priveleges for the new class. The problem then becomes, how do they identify themselves? If they don't know code and can't transmit voice, I see a problem.

Phil brought up an important point, about the crowding on 2 meters, especially in California (We are not far from it in the Midwest).

How 'bout something in between, like voice is ok, but no repeater operation?

I think it is too bad that the 2 meter band was chosen for some of the satellite operation. I don't recall AMSAT worrying about congesting 2 meters.....

I have been carying 2m handhelds on about 5 domestic flights and never had
problems - I always stated that 'I would not use them because
it is not legal'.

Once I got into trouble - in West Germany. There security people told me

that I would not be allowed to take it on board - I could
threaten to explode a bomb in my suitcase with it.....

Subject: HAM radio use on airliners
X-Google-Info: Converted from the original B-News header
Posted: Tue Dec 14 13:51:08 1982
Received: Wed Dec 15 08:02:06 1982

It seems that a large number of HAM's are under the impression that
they can use portable radio equipment on board an airliner as long
as they ask the crew and get their permission.

THIS IS INCORRECT - HAM RADIOS ARE ILLEGAL ON AIRLINERS

Although Part 97 of the FCC rules indicates that the pilot can give
permission, the FAA's rules (FAR 91.19c) states that only the airline
itself, and not the pilot, can give permission to operate. The rules
are quite explicit on this point, and I wish you the best of luck in
trying to get official airline permission to operate (as far as I know,
it has only happened once in the mid 70's. The operator was an airline
maintenance employee and helped do the required testing).
Whenever a HAM is aboard an airliner, that person is bound by both
Part 97, AND the Federal Aviation Regulations (FAR's), even though
the FCC hasn't realized it yet.

I've seen what my 2 meter rig can do to aircraft navigation radios,
and I sure wouldn't want to be on an airliner that was experiencing
the same kind of interference.

There's good reason not to allow ham radios on airliners. The
potential for messing up the cabin pressurization system isn't one of
them. Sorry, Adam, but there's no way that could happen.

In following up the reply to Adam's article, I don't think Adam
meant that the HT was likely to have any effect on the
pressurization controls. The problem is that if anything that is
obvious to passengers DOES go wrong, the poor guy with the HT is
going to be blamed for it! Mostly a PR problem for him, and for the
airline who let him fly with it!

I haven't seen an answer to the original question, which is
"if airline nav equiptment is so sensitive to RFI, then how much
RFI does it take to mess it up?". In particular, can ground radios
affect it, or does the faraday cage nature of the cabin keep the RFI
out of the sensitive parts? And if so, what does that say about the
new composite aircraft (such as LearFan) made of fiber/epoxy (no
Faraday cage effect)? Also, what about calculators, computers, etc.
I have heard that microprocessors, and radio receivers are banned
for similar reasons, but I have yet to be asked to remove the battery
from my digital watch for the duration of the flight. What's **REALLY**
going on here? Is this just the FAA being Pleistocene?

Received: Tue Dec 21 07:32:59 1982

The article on page 59 of the December issue of QST stated that it was
permissable for the captain of a "nonscheduled airliner" (italized in
QST) to give permission for ham operation. Captain Russell has
erroneously added an interpretation to the rules that is incorrect!
The Federal Aviation Regulations made no distinction between scheduled

and nonscheduled airlines for the purpose of portable electronic device operation. Since there seems to be so much confusion about this regulation, here is the full text:

91.19 PORTABLE ELECTRONIC DEVICES

a) Except as provided in paragraph (b) of this section, no person may operate, nor may any operator or pilot in command of an aircraft allow the operation of, any portable electronic device on any of the following U.S. registered civil aircraft:
   1) Aircraft operated by an air carrier or commercial operator; or
   2) Any other aircraft while it is operated under IFR.

b) Paragraph (a) of this section does not apply to:
   1) portable voice recorders;
   2) Hearing Aids;
   3) Heart pacemakers;
   4) Electric shavers;
   5) any other portable electronic device that the operator of the aircraft has determined will not cause interference with the navigation or communication system of the aircraft on which it is to be used.

c) In the case of an aircraft operated by an air carrier or commercial operator, the determination required by paragraph (b)(5) of this section shall be made by the air carrier or commercial operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

qst de ad7i

hr propagation forecast bulletin nr 51   from arrl headquarters
newington ct december 19, 1982
to all radio amateurs bt

the solar flux went above 200 december 4, reached 279 six days
later, and then dropped sharply to 179 on the 19th. because of many
solar flares, at least two of nearly record intensity, the period of
high flux was rather disapointing. there were marginal east west
50 mhz openings, but nothing like those of the three previous years.
propagation on lower frequencies was no better than fair, except for
a short period near the middle of the month.

the solar flux is expected to continue downward through the forecast
week, but this will not affect the traditional dx bands appreciably.
in fact, the lower geomagnetic activity will mean higher average
signal levels and less fading than in the past week.   propagation
via the f layer is unlikely on 50 mhz east west paths. north south
50 mh work should be possible when the wwv k index is 3 or higher.

a severe disturbance in progress as this bulletin was issued will
decrease, bringing genrally good propagation december 22 through
24, and again in the last 3 days of the old year. the prediction
charts in december qst should be on the conservative side in this
period.

american sunspot numbers last week were between 86 and 136, for a
mean of 119 ar

As for other rfi, once while waiting for others to board a flight from
Denver to Newark, I was speaking with the flight engineer requesting permission
to "listen only" to my 2 meter ht during the flight. His comments were
interesting ... He said that many times hand calculators and electronic games
used by passengers during flights presented a significant interference
problem to the instruments. He said that some times, some electronic games
were so bad that they had to walk through the cabin looking for the offensive
device and request that the passenger turn it off!

       _3_0__M_e_t_e_r_s_. U. S. amateurs are reminded to avoid use of the
       10.109 to 10.115 MHz segment of the new band. Also,
       contacts on the 10 MHz band will not be creditable toward
       ARRL awards.

       _K_e_r_g_u_e_l_e_n__I_s_l_a_n_d_. FB8XR is expected to become active at
any
       moment for a three month operation by F6GVX. In a similar
       operation, F6DWQ will operate FB8ZP from Amsterdam and St.
       Paul Islands for 11 months.

_R_o_d_r_i_g_u_e_s__i_s_l_a_n_d_. Alex, 3B8DA, will be going to Rodrigues Island about the 18th for a week as 3B8DA/3B9.

_T_r_i_n_d_a_d_e_. PY00TA and PY00TB are expected to begin a 34 hour all band operation at any time.

_T_r_i_n_i_d_a_d__a_n_d__T_o_b_a_g_o_. 9Y4PW has been quite active on the low end of 20 meters, around 14228 kHz at 1200Z. QSL to G4DXC.

_M_a_r_i_o_n__I_s_l_a_n_d_. Rumor has it that ZS2MI will be on before the end of the month.

_C_h_i_n_a_. A new Chinese station, BY1BC, is expected soon. The antenna is ready to go, but rig problems are delaying its start.

_N_e_p_a_l_. Four operators including a YL, plan to operate from 9N1 through January 1 on all bands, ssb and cw.

_I_r_a_q_. YI1BGD has been on recently on 10 and 20 meter ssb between 1200 and 1600Z. He is also sometimes on with JY3ZH on 14220 kHz at 0630Z.

_H_e_a_r_d__I_s_l_a_n_d_. The DXpedition plans are progressing on schedule. After departure on January 2, keep in touch via VK00SJ/MM.

_T_u_n_i_s_i_a_. 3V8AA has been active on 28745 kHz at 1300 to 1400Z.

_S_y_r_i_a_. The Technical Institute of Radio will celebrate 35 years of amateur radio in Syria with 6C35A, 6C35M, 6C35N, and 6C35O operating 80 through 10 meters, ssb only, between 0300Z December 25 and 1300Z December 26 and between 0300Z December 30 and 0800Z December 31.

qst de ad7i
hr propagation forecast bulletin nr 52 from arrl headquarters
newington ct december 27, 1982
to all radio amateurs bt

from a high of 279 december 10 the solar flux dropped to 156 by the 21st. it then rose to 176 but was back to 172 on the 27th. it is expected to move slightly lower before beginning what should be a considerable rise at the years end. the december average will be about 178, the highest since march.

these statistics show cycle 21 maintaining quite high activity for more than four years. dx work has been possible on 50 mhz since late in 1978, a record that might stand for a long time. sunspot numbers and the solar flux have been mostly above base figures used for the qst propagation charts, so the muf has been higher than the charts predicted, much of the time.

recent high solar activity has not been an unmixed blessing, as frequent solar flares and high geomagnetic activity have increased signal absorption on paths that cross or paths near the auroral zone. only about 5 days this month were really good for hf dx. conditions were improving as this bulletin was issued. propagation should be generally good through the end of december, and again around january 3 and 10 to 12. except when the wwv k index is 3 or higher, the f layer muf will tend to be above that shown in the qst charts. the timing of daily muf on a given path is based mainly on sun position, d this factor should follow the charts closely, regardless of flux levels.

american sunspot numbers were not available at bulletin time ar

I need a few tubes for my Drake T4XB and R4B and am considering
buying a complete set of replacement tubes.
However, this is quithe costly if the tubes are purchased from
a local electronics shop.

Can anyone recommend a good source (mail order or whatever)
for inexpensive high quality tubes?

I am interested in info on the Sony ICF-2001 receiver. It is a digitally
controlled HF receiver in a package the size of a book.

Specifically, I am interested in specs like selectivity, coverage,
BFO, etc. and also user experience.

References to articles about it would be nice. Also, if you own one
and live in this area (Northern NJ) and could give me a demo, that would
be great.

Thanks,

This weekend's contests include:

World 40 Meter and 80 Meter SSB Championships

Sponsor: 73 Magazine

Time: 40 Meter contest: 0000 to 2400Z January 8
       80 Meter contest: 0000 to 2400Z January 9
       (Two separate contests!)

Stations may be worked once per band, phone only.

Exchange: Signal report and state or province

Zero District QSO Party

Time: 2000Z Jan. 8 until 0200Z Jan. 10

Exchange: signal report and ARRL section
          0-land stations send county also

Stations may be worked once per band and mode. Mobile
stations may be worked (0 land only) again as they change
counties.

Suggested Frequencies: cw: 60 KHz up from low end of band
                      phone: 3.900, 7.270, 14.300, 21.370, 28.570
                     novice: 25 KHz up from low end of Novice band

14 MHz SSB Contest

Time: 0000Z to 2400Z January 9

Exchange signal report, serial no. starting with 001 and International
Short Wave League membership no. (if any)

Suggested Frequencies: 14.175 (dx) and 14.225

UOSAT SPACECRAFT CONTROL CENTRE
UNIVERSITY OF SURREY, GUILDFORD, SURREY, ENGLAND
****

UOSAT SPACECRAFT OPERATIONAL STATUS:
****
** UOSAT BULLETIN-11   1400 GMT   7 JANUARY 1983 **

* S/C ATTITUDE *

THE EFFECTS OF THE INCREASE IN Z-SPIN PERIOD PERFORMED BEFORE CHRISTMAS TO ENSURE THERMAL STABILITY DURING AUTONOMOUS OPERATION OVER THE LAST TWO WEEKS HAVE BEEN MEASURED. THE Z-SPIN PERIOD FELL FROM 153 SECONDS TO APPROX 60 SECS, AS THE PRECESSION CONE ANGLE DROPPED FROM 55 DEGREES TO AROUND 15 DEGREES. THE NUTATION ANGLE IS ALSO MUCH REDUCED. THIS ATTITUDE EFFECT COULD BE READILY OBSERVED BY MONITORING THE SPACECRAFT BATTERY TEMPERATURES, WHICH CHANGED FROM AN INITIAL CYCLIC VARIATION BETWEEN -17C AND 2C TO A STEADIER 7C DURING THREE WEEKS.

* S/C OPERATIONS SCHEDULE *

MAGNETORQUER MANOEUVRES TO INCREASE THE Z-SPIN PERIOD TO 108 SECS HAVE ALREADY BEEN PERFORMED, AND THIS WILL BE FOLLOWED SHORTLY BY THE RESTORATION OF THE PRECESSION ANGLE IN PREPARATION FOR GRAVITY GRADIENT STABILISATION. COMPUTER-GENERATED MAGNETOMETER DATA WILL BE HEARD ON THE 435 MHZ DOWNLINK WHEN IT IS ACTIVATED OVER EUROPE.

* THANKS FOR FEEDBACK *

By Lyle Johnson WA7GXD, and Dan Morrison KV7B

BLACK THURSDAY

All was going well. The parts were in hand, PC boards delivered and volunteer (slave) labor lined up for the BIG PUSH -- would you believe Beta TNCs in time for Christmas?

Neither would Murphy! On Wednesday, 8 December 1982, the first TNCs were delivered to TAPR from one of the two assembly plants. The first one worked perfectly! Unfortunately, by 2:00 AM, Thursday, 9

December, a serious problem was very apparent. "Black Thursday" was upon us. Only 3 of the first 19 TNCs were functional.

After a fitful (morning's) rest, an emergency meeting of the TAPR executives was called, production halted, and an investigation into Murphy's doings launched.

It turned out that there was a problem in the plate-through job on the PC boards, meaning that the top half and the bottom half of the board were intermittently (dis)connected. The 119 TNCs assembled by the time of the halt in production were sent to the scrap bin, and an assessment of the damages made. The losses were a staggering $8600!

TAPR, being in no position to absorb such a blow, determined to finish the project anyway. A salvage operation was mounted, and in the end there is a $3000 loss to contend with -- not insubstantial, but one that, with a judicious amount of finagling, and some voluntary $upport from those interested in seeing this thing through, can be overcome. New boards were ordered fabricated (free) and parts to populate the boards re-ordered.

After a few slips in the schedule, 10 boards were received the week of 28 December 1982. Two were hand-assembled by WA7GXD, and worked the first time. Three were assembled by one of the two assembly plants, wave-soldered and delivered. All three worked!

The delay time was used by both the software group, for additional debugging and refinement, and the hardware group, for additional testing and interfacing. Meanwhile, the approximately 70-page TNC Manual is being edited and clarified.

The present schedule calls for board assembly to begin the week of 9 January with assemblies delivered to TAPR late in the week of 16 January. The boards will then be powered up and power supply voltages checked. Passing this test, the ICs will be loaded and calibration performed on the MODEM. Finally, the TNC will "connect" to itself via a digipeater, then be packed up, along with the manual, for shipment to the Beta coordinator. The Beta coordinator will then be responsible for distribution of the TNCs to the individual site participants.

It has often been asked if the TAPR TNCs will be compatible with the Vancouver TNCs, and the answer is

an emphatic YES! Harold Price, NK6K and co-author of the high-level PASCAL software, established a connection with Skip Hanson, WB6YMH, in Los Angeles on 8 January 1983. Harold was using a Beta TNC, while Skip used a VADCG TNC. Packets were exchanged for a half-hour or so, and the test was a complete success!

The initial software released with the Beta boards is a version of the AMSAT protocol agreed upon in Washington DC the weekend of October 8th, in addition to the more-or-less standard Vancouver protocol in general use. The software is outlined in more detail below.

SOFTWARE UPDATE

This update would be written by Margaret, KV7D, rather than by me (KV7B), except that as these words are being composed she is putting the last bells and whistles in the TAPR/AMSAT AX.25 level 2 protocol software which will appear on the TAPR Beta board at time of distribution. The people responsible for this monumental effort are: Dave Henderson, KD4NL, who was responsible for implementing the protocol; Margaret Morrison, KV7D, who put together the entire package of real-time assembly language routines and debugger; and Harold Price, NK6K, who built the extremely flexible command parsing language. Of the 24k bytes of PROM on board, 22k are used in this release. The high-level routines were written in compiled Pascal, and occupy about 16k of the total. The entire development time was roughly from the AX.25 protocol meeting in October until today (mid-January).

The simplest description of the software is that it's everything any of us dared to hope for and more. Not only does it implement AX.25 level 2 protocol "by the book," (it follows the October 10 document produced at the AMSAT meeting, based on the AMRAD recommendations; and where ambiguities exist, follows Ma Bell's BX.25, issue 2 document), but it can also operate in Vancouver compatibility mode with no problems.

Present at this time are some 66 user settable parameters for controlling the behavior of the board, many of them for determining the details of terminal communication. In this short space only a few highlights may be mentioned, but they include such items as hardware and software flow control, separately controllable in either direction, with the software flow control characters being user definable. In order to permit total transparency a single command defeats all special character traps and packetizes according to

timer and packet length criteria. At the other extreme, input editing at the character and line level are available, including a separate "cancel packet" command.

Perhaps the most important features are the elaborate timer operated CSMA procedures, including (all user settable) separate key-up delays for digipeating and originating packets, separate delays for voice repeater key-up and tail-drop times, and random wait times after collisions. Flow control on the RF link also involves time delays. Altogether, there are ten distinct timer functions associated with the RF link, requiring 4 separate clocks to be maintained by the interrupt driven routines.

All in all, the functions presently on board should be more than adequate for the "shakedown cruise" coming up during Beta Test, and future releases will have even more features (we've still got 2k PROM to go before adding the next deck to the board!).

LOCAL AREA NETWORKS VIA PACKET RADIO MEDIUM

Den Connors

University Computer Center
University of Arizona, Tucson, Arizona

Abstract

Investigations are underway by the Amateur Radio community to incorporate digital communications techniques into the Amateur Service. The network system utilizes simple techniques, using normal terminals and personal computers, and a wide variety of amateur radio transceivers. Complete local area network protocols are realized by incorporating a micro-processor based interface unit to connect the terminal device and radio. Physical-level protocol involves half-duplex transmissions with frequency-modulated transceivers. Channel activity is sensed by the packet radio, and negative acknowledgement used to determine if retransmission of lost packets is required. A data-link control is also implemented, and two connecting protocols are being tested on top of these lower levels. The TAPR/AMSAT protocol provides multiple point-to-point connections on the channel. The TAPR/DA (dynamic-addressing) protocol implements a full datagram network, and uses a robust network control scheme to provide near-optimum channel utilization and network tolerance to a number of error conditions related to open radio channels.

Introduction

The Tucson Amateur Packet Radio group is currently coordinating a series of tests with Amateur Radio operators in eighteen major U.S. cities, to investigate the use of digital computer and terminal communications using packet radio techniques. Initial investigations are being performed on the Amateur Radio Service VHF bands, using half-duplex transmissions. Two sets of experiments are being undertaken; the first is testing multiple simultaneous connections on a single shared frequency, while the second tests a new form of efficient radio frequency local area network.

A general description of the system is given in terms of the signals and medium access. This is followed by information on the hardware implementation. A more detailed description of the signalling technique, data link protocol and the two types of link and network protocols are described.

Physical and Medium Access Protocols

Both protocol tests are using a common medium. Access to the radio channel is accomplished using audio frequency shift keying within the normal audio communications passband. The packet radios are able to detect digital communications on the channel, and will defer transmissions while there is activity on the channel. Collisions, interference and unusual conditions (fading, multipath, etc.) which cause unsuccessful transmissions will result in no acknowledgement, and an automatic retransmission will result after a set delay. Multiple unsuccessful transmissions will produce an error indication at the data source. Successful transmissions will result in an acknowledgement being transmitted to the originating station. The acknowledgements may occur after each packet, or may be deferred for up to seven packets, using standard high-level bit-oriented data link protocol (HDLC), implemented with large-scale integrated circuitry.

This multiple-access protocol is therefore based on on-channel data sensing, with negative acknowledgement causing retransmission (data-sensed multiple-access with collision-detection by negative acknowledgement, or DSMA/NAK). It should be noted that the normal LAN technique of carrier-sensing is not appropriate to the Amateur Radio Service, where all manner of signals are apt to impinge on the data channel. Use of much less occupied bands is possible, and conversion to carrier-sensing trivial. However, the choice of using the more heavily-used bands was made to provide exposure to the general population, and promote acceptance of this new mode.

Hardware

The Tucson Amateur Packet Radio Corporation (TAPR) has created a single-board packet radio terminal node controller (TNC) which interfaces standard microcomputers or data terminals to commonly available Amateur Radio transceivers.

Initial investigations in Tucson are using the two-meter band (144-148MHz), and both this band and others will be used in the other seventeen test sites. This band was chosen for maximum visibility

within the Amateur community.

The transceiver interface is performed without modification to the unit by using the three normally-available signal lines; audio input (microphone), audio out (speaker) and transmit (push-to-talk). This ease of equipment configuration was the primary reason to use audio-frequency shift keying, and to keep the modulating signals within the audio passband.

The digital data from the terminal or computer is fed to the packet radio interface board either through a standard RS-232 serial interface port, or by using a custom parallel interface. TTL-level lines are provided on the board for these connections, and a wire-wrap area is also included for non-standard interconnects.

The TNC accepts the serial or parallel data and formats the data into packets, using the standard HDLC format as described below. These serial packets are encoded using a non-return-to-zero inverted (NRZI) code to assist in providing an audio signal for the demodulator to lock on, using phase-locked loops. This NRZI data is presented to the audio FSK modulator, and the modulated signal is fed to the audio input of the transceiver.

The received signal appears as an AFSK signal on the audio output of the radio. A side benefit of using standard Amateur radios is the availability of a speaker for monitoring the channel while the experiments are in progress, although experience suggests that continued monitoring can be most distracting.

The signalling tones used to modulate the radio were chosen to be compatible with those of the Bell 202 half-duplex modem set of standards. This was done both to use a well-tested pair of frequencies with much operating experience, and to allow earlier experimenters with surplus 202-type modems to use their equipment, expanding the size of the test community. The main drawback to the 202-type modem is the limitation of 1200 bits/second of data transmission. Further experimentation is planned for higher-speed phase-shift keying modems within radios built expressly for packet radio service.

Hardware also exists on board to handle packet

encoding and decoding, buffering, and system initialization and calibration. All components necessary to provide the channel access and data link control, as well as network protocol, are also contained on the TNC. A built-in modem and power supply minimize the complexity of installation.

Data Link Control

Both protocols being investigated use similar data-link protocols, although there are differences in addressing modes. An HDLC controller integrated circuit provides most of the circuitry for building and disassembling the packets. HDLC framing signals, address bytes, control byte and trailing cyclic redundancy check bytes are employed without modification. Successful packets are acknowledged on receipt, using standard HDLC control modes. Each packet is checked for correct CRC calculation, and the acknowledgement packet is withheld if the CRC is incorrect. This forces a retransmission by the source station. Retransmitted packets are thereby forced either by incorrect CRC calculation or by having been interfered with (collisions or unwanted signals). Collisions of packets are minimized by the data-sensing capabilities of the packet radios.

The decision of the next time to retransmit a packet will be weighted by a binary-exponent random back-off algorithm, similar to that used by Ethernet-like systems. This minimizes the possibility of continuing collisions by radios with nearly-synchronous retransmission attempts.

Unlike most LAN media, the open radio channel susceptibility to intentional and unintentional interference adds complexity to the link-level algorithms used to reschedule transmissions. Another problem is the phenomenon of "capture" of the receiver demodulator by FM signals stronger than that of the desired signal.

Connection-Oriented Protocol

The first protocol used to exercise the packet radio system was one developed simultaneously by groups in the Los Angeles and Washington, D.C. areas, and approved and "standardized" at a meeting sponsored by the Radio Amateur Satellite Corporation (AMSAT) in October of 1982. The

implementation of this TAPR/AMSAT protocol provides a means of connecting pairs of packet radios with a communication channel transparent to other users of the shared channel. While lacking some of the capabilities of a full local area network, this protocol nonetheless provides a means of experimenting with channel capacity, access algorithms and system parameters.

The TAPR/AMSAT implementation provides the same types of functions as the link-access protocol of X.25. Connection and disconnection, error indications and control, and flow control are all provided. Virtual circuits are supported on the channel and channel-wide monitoring is available.

The addressing scheme is unique, in that the Amateur Radio Service has associated with each station a single call sign, that of the station owner/operator. The packet radios have made use of this uniqueness to provide unambiguous addressing, both within LAN's and across future internetwork gateways. A serious drawback is the requirement of seven bytes for both sending and receiving addresses, but on the half-duplex channels currently in use, this added overhead is not noticeable.

A further enhancement allows extension of the network to larger geographical areas with any of the stations acting as a store-and-forward packet repeater. Stations requiring repeat services use bits in the HDLC control word to signal the need to have a message repeated, and repeated messages turn off this bit to prevent possible multiple acknowledgements.

Although this protocol is designed primarily for point-to-point links within a larger multi-point network configuration, it does lend itself well to some of the needs of the shared-channel packet system, including terminal-to-host and host-to-host connections.

Datagram Protocol with Dynamic Addressing

The second protocol being used in the packet radio experiment test beds has a more efficient addressing scheme, providing each station with a mechanism to obtain a one-byte address when first accessing the network. This dynamic-addressing protocol, called TAPR/ DA, provides a full network

configuration with connectionless protocol and a centralized, failure-tolerant network control mechanism.

The unique aspect of this LAN protocol is this utilization of dynamic address allocation. A network control station (NCS) monitors for stations attempting to sign on, and replaces the amateur radio call sign sent to the NCS with a single byte address for efficiency. Each station then has available from the NCS a list of users (amateur call signs) and corresponding assigned addresses. This list is the system status table. For robustness and ease of switching to other radio channels, the first station on any given frequency will automatically be chosen as the NCS, and in the event of loss of this station, the next station attempting transmissions which require the NCS will become the NCS.

This protocol also supports a store-and-forward repeat capability. The possibility of hearing stations in a different network geographically remote, but using the same frequency requires special algorithms. The conditions of multiple store-and-forward digipeaters, network control stations or identically-addressed stations must be detected and corrected.

Future Research

Currently experiments are underway to further extend network topology through the use of specified stations as network-to-network links, using separate radio channels. Additionally, the use of amateur radio satellites is being planned.

Acknowledgements

The author wishes to acknowledge the efforts of Lyle Johnson, who is the principal architect of the terminal node controller hardware. Margaret Morrison, Harold Price and David Henserson wrote the TAPR/AMSAT software for the system, and Marcus Chamberlin and David McClain produced the TAPR/DA software. Design credit also goes to all of the above, as well as Charles Green, Mark Baker and Dan Morrison for several design concepts. Further gratitude is given to the 180 hams who have volunteered a wide variety of resources to help test the system.

"An electrical signal in a conductor, under suitable conditions of very
 low L and C values, can be made to pass through a conductor at a velocity
 considerably greater than that of light."

So concludes Harold W. Milnes, Ph.D, in the January 1983 issue of
"Radio-Electronics" in an article that begins on page 55.

I found I did not agree with parts of the article. I would be interested
in comments from others who have read the article.

Under certain propagation conditions (not necessarily in a conductor; the same thing can happen to a wave propagating in a plasma), an electrical signal *can* travel at a velocity greater than light.
But that is only true for the phase velocity. The phase velocity is the velocity of a wave of a single frequency, which means that signal has a constant amplitude for all time.
The key point is that the group velocity *cannot* exceed the speed of light. The group velocity is the velocity that a modulation envelope (whether amplitude modulation, on-off cw pulses, or whatever) will travel at. The difference arrises because modulation involves propagating signals of many different frequencies (remember Fourier) which travel with different velocities (the faster-than-light phenomenon only occurs in dispersive media). Thus *information* still cannot travel faster than light, and information propagation is what relativity is concerned with.

> _H_e_a_r_d__I_s_l_a_n_d_. The VK9NS expedition had navigational problems and had to return to Tasmania. It is not yet known if this trip will be resumed. The VK00HI crew is progressing on schedule and is approximately 800 miles from Heard Island. Operation may be expected around the 15th.
>
> _T_o_g_o_. N6NW plans to operate as 5V7NW or 5V7HL from January 15 through 24, ssb only. Frequencies will be 21300, 14225, 14195 listening up, and 3795 kHz. He expects to be very active on the weekends and after 1800Z during the week. QSL to AK3F.

_N_i_u_e_. ZK2RS is active, especially during the weekends, between 28500 and 28600 kHz at 2200Z.

_P_i_t_c_a_i_r_n__I_s_l_a_n_d_. Congratulations to Tom Christian, VR6TC, who was recently awarded the honorary "Member of the British Empire" by Queen Elizabeth. YL operation from Pitcairn by VR6KY is expected for two weeks beginning January 12.

_N_o_r_t_h__C_o_o_k__I_s_l_a_n_d_. ZK1WL will be active for the next six months.

_R_o_d_r_i_g_u_e_s__I_s_l_a_n_d_. Alex, 3B8DA/3B9 has been heard on 14217 kHz at 0230Z.

_S_o_u_t_h__S_h_e_t_l_a_n_d__a_n_d__S_o_u_t_h__O_r_k_n_e_y__I_s_l_a_n_d_s_. Look for operations by LU1ZA and LU1ZC around the end of January and first of February.

_K_e_r_g_u_e_l_e_n__I_s_l_a_n_d_. FB8XAB is often on 14220 kHz around 0330Z. QSLs go via F6GXB.

_F_r_a_n_z__J_o_s_e_f__L_a_n_d_. UK1PGO can be found on 20 meter ssb and cw between 1100 and 1300Z. Watch for him on 14215 and 14204 kHz.

_C_h_i_n_a_. BY8AA has been putting through a good signal on the east coast during the evening hours. He is now operating split, so please do not call on his frequency.

_H_e_a_r_d__a_n_d__W_o_r_k_e_d_. JW5VAA 10101 kHz at 2200Z. QSL to LA4YW. Remember that 10 MHz contacts are not creditable toward ARRL awards. 7P8CL 7003 kHz at 0350Z. QSL via SM5GOJ. CE00CEW Juan Fernandez 14035 kHz at 0150Z. KA2PFV/SV9 28555 kHz at 1330Z. QSL to P. O. Box 301, Iraklion, Crete. OE2TWM/YK 28595 kHz at 1400Z.

Any hams out there going to UNICOM in San Diego?
Maybe we could have an 'eyeball QSO party'!
Send me your name and call and if enough replies arrive I will summarize to
the newsgroup.

Subject: A noisy problem
X-Google-Info: Converted from the original B-News header
Posted: Sat Jan 15 23:20:44 1983
Received: Tue Jan 18 08:41:57 1983

With help from various people, I have managed to track down a source of noise
which has plagued me ever since I got my first rig seven months ago. The noise
has got worse over those seven months to the point that it will obliterate
all useful HF bands on my rig for a period of as much as a week. I looked
at the rig's audio output with a scope and the noise is basically a 120Hz
spike with some ringing. I won't bore you with all the blind alleys I followed!
The problem turned out to be one of two transformers in the substation which
feeds this whole residential area. One of the beams that supports some lightning
arrestors and insulators has a ground wire running along the underside and this
wire is stapled to the wood. Neither the staples nor the wire are insulated.
The problem was one of those staples! According to the DOC inspector who
accompanied me to the substation (and who has the expensive ultrasound gadget
that detected the problem) said this is a common cause of noise. It seems that
there are so many high-tension wires around there that sometimes a path to
ground can occur through the wood. He says that in some substations there
is so much juice around that the power crews won't even touch supporting
guy wires unless they know it is safe.
I thought I would pass along the basics of how the problem was ultimately
tracked down.
1. First of all prove that the noise is not in your rig, not due to faulty
house wiring and NOT due to a light dimmer. The first thing DOC asked me
when I first complained to them was ' have you got any light dimmers'.
They can be a dreadful source of interference.
2. Once you are satisfied that the noise is power line related but coming
from outside then all you have to do is locate the fault. Our area has
overhead wiring. If your power is distributed underground then about the

only thing you can check is the transformers. If your power is above
ground then the noise can be detected by using essentially the same technique
as the DOC. Find the highest frequency at which you can just hear the noise
and walk (or drive) around the neighbourhood to find out which direction
gives you the strongest signal. (If you have a beam antenna then you are a long
way towards solving it. If you also have a nearby friend with a beam you can
triangulate and its done!). Then walk in the direction of the noise and
increase your listening frequency as the signal gets louder. At some point
you should locate the noise. I was almost certain the noise was coming from
the transformers anyway so we checked it first and the 2 meter rig confirmed
it. Those rigs are really useful because the two transformers are only about
15 feet apart and because of the fence around the substation you cant get closer
than about 15 feet. Even so, the mobile rig indicated, and the handheld 100%
confirmed, that the noise was coming from only one of the transformers.
The reason for this is, of course, that most of the energy caused by the arc
goes into the lower frequencies so that you have to be close to the source
of the noise for it to interfere with VHF rigs. The arc is also the reason
why there is a 120Hz spike - one for each half cycle of the 60Hz power wave.

Another cause of interference is arcing insulators or lightning arrestors.
With overhead wiring the fault could be one of those two or simply a loose
connection somewhere and finding out where the noise is NOT, is sometimes
as valuable as knowing where it IS. In my case I found that the noise also
occurred in my daughter's piano teacher's house which is about 10 blocks
away and which is also fed from a different phase than our house. BUT
we are both on the same transformer. If you suffer from power line noise the
fault could be much closer to home. For example, the local transformer
that supplies power to your block.

If anyone has questions about this I will be glad to answer mail but I should
stress that I am NOT an expert in this sort of thing. If necessary, I will
summarize to the net. I am also interested in hearing of any noise problems
(no matter what source ... e.g. cordless phones etc.)
you may have had for which you have a solution - post them to the group
or mail to me.

I should mention that the ultrasound device that the DOC uses
looks like a bullhorn but it has a parabolic dish and a pair of headphones.
I presume that it uses the doppler effect to convert the motion of an abject
into sound. Anyway, the DOC inspector let me try it and there was no doubt
that it was the staple. You could point the thing at the staple and hear
it vibrating like crazy and only an inch or so away there was silence!

I have been looking at 2M Hand-held rigs since I now can afford to
splurge on one and would have liked to have one to take to San Diego.
In Canada the TR-2500 costs about $439 , the FT208R costs $319, or
$289 from a place that just happens to be out of stock! The IC-2AT is $309.
The Azden and the Santec are not in the race for me unless I can find
a Canadian supplier.
 Of course, the Kenwood and Yaesu are fully
synthesized (10 memories, scanning etc.) and the Kenwood is a better
designed rig than the Yaesu but I don't think it is $120 to $150
better. The ICOM is a neat beast as long as you don't mind thumbwheel
entry (and NO memory, scanning etc.).
Questions.
1. Is anyone out there in a position to say whether
ICOM is going to come up with a fully synthesized rig to take out the
other guys? In Canada, the difference of only $10 between them and
the 208R suggests that their sales have to be slowing down a bit.
(Although I doubt that Canadian sales are a determining factor in their
marketing strategy, I think the same type of thing is happening in the U.S.)
It seems odd that their mobile rigs (e.g. 25a) are marvellous little
beasts with memory, scanning and so on, but their H.T. has still got
thumbwheels.

2. Yaesu has recently dropped their price on the 208R by about $100
and they did the same sort of thing to the FT-101-ZD just before they
brought out the FT-102. Anyone know if they are just trying to compete
with the TR-2500 (as the Kenwood supplier disdainfully told me "Our rig
is better") or is there something better coming down the pipe?

Please mail to me.

Jan 14,1983 -- The Radio Amateur Satellite Corp. (AMSAT) and the Volunteers In Technical Assistance (VITA) {note -- pronounce as VI-TAH as in the word vital} have today announced their intent to pursue a joint effort to develop a low-cost packet radio satellite system called PACSAT.

VITA, headquartered in Rosslyn, VA, is a private, nonprofit organization that supports people working on technical problems in developing countries with technical information provided by thousands of volunteer scientists, engineers and technologists. The information and assistance VITA provides is aimed at helping local people in developing countries to select and implement technologies appropriate to their local situations.

VITA Director Henry Norman and VITA Project Coordinator Dr. Gary Garriott (WA9FMQ) today announced that VITA has just awarded AMSAT a $15,000 Design Definition Grant to support development of PACSAT as a reliable low-cost digital satellite system to meet requirements for communications of technical information on renewable energy resources to and from their many field locations. AMSAT's role in this joint activity will be to provide hardware suitable for demonstration programs and to provide technical assistance in developing a low-cost system. Part of this effort will involve adapting solar power, amateur radio and personal computer technology for use in the field, far removed from any technical support.

AMSAT's PACSAT project manager Den Connors (KD2S) indicated that this grant will support initial PACSAT design definition activities which are being coordinated by AMSAT with work being done in some 15 locations around the world.

It is also of interest to note that WA9FMQ is a cousin of NASA astronaut Dr. Owen Garriott, W5LFL who may be amateur radio's first "space mobile" by operating from the Space Shuttle if a proposal submitted by AMSAT and ARRL is approved by NASA.

Two additions to my item on power line RFI:

The Interference Handbook is published by Radio Publications, Box 149,
Wilton, CT 06897, and is available through most of the ham radio
distributors.

I meant to say "Naperville Electric Dept" instead of "Naperville
Electric Co". Part of the problem was that I was dealing with a small
municipal agency who bought power from Commonwealth Edison and
maintained the local distribution network. They were simply too small
to afford the RFI specialists that large companies hire.

Phil

Here's a book I can recommend to anyone interested in the details of interference troubleshooting:

Interference Handbook, by William R. Nelson, WA6FQG, Former RFI Investigator, Southern California Edison Company.

As you might expect from the author's former job, he is very thorough in his discussion of the myriad ways power distribution networks can cause RFI. His method is very similar to the one Peter Hardie used to find his noisy transformer.

I got interested in the problem of power line interference by necessity (the usual route.) When I lived in Illinois, a dual 138kv transmission line passed my house 10 houses away. As it turned out, the poles near my house were not a problem, but the "corner towers" 1/2 mile away where the line made a Z turn along a road toward a substation. The symptoms were somewhat strange: slowly rising horizontal static "bars" on the TV, and intermittent broadband noise pulses ruining 2 meter SSB (especially Oscar-7 mode B) reception. During heavy rainstorms, the noise would go away instead of getting worse!

Although Oscar-7 failed in the summer of 1981, and I subsequently moved to NJ without the problem never really being resolved, I was reasonably certain I understood the problem.

Ground lines running across the top of high-voltage towers are there to take lightning strikes, which could occur as often as every day or two during the late summer in Illinois. Although the ground lines were firmly clamped to the towers on the straight runs, at the corners a double-loop "dead-end" was used, with no hard connection between the ground line and the tower.

Significant amounts of current were induced in the ground line from the power conductors, and arcing occured at the dead-ends. When it rained, however, my theory is that it temporarily suppressed the arcing and the interference.

Fighting power line interference can be an exhausting experience. I spent many hours on the phone, riding around with the Naperville Electric Co maintenance men, and in desperation, writing letters to the Mayor and the FCC, all with only partial success.

The best medicine is preventative - don't live near a large power line!!

Subject: Program to Calculate UOSAT Crossings
X-Google-Info: Converted from the original B-News header
Posted: Tue Jan 18 10:48:24 1983
Received: Thu Jan 20 03:24:11 1983

I have been trying to listen to UOSAT for about 3 months now with the frustration of trying to determine when the next pass will be. Many a time I have missed it due to miscalculations or having to wait up to 1 hour for its crossing. Having had enough of this, I have devised a simple program for the HP33 series calculator that, given UOSAT data from this net, calculates the passes of UOSAT quite accurately -- even two weeks ahead is within a few minutes! This program could be adapted to any calculator; the program is self explanatory.
Note that this program does not factor in the drag coefficient given in the UOSAT data. This program was not meant to be that

sophisticated. Also, for best results, use the latest info for the
initial conditons of the satellite and orbital data.
The following registers are used:

0 number of iterations. Once the calculator has stopped, the
   display will read the number of passes past what was
   computed, ie, it will have a negative number for each time
   the program is run past the last iteration.
2 This contains the present longitude for each calculation.
   Initialize it with the information from the UOSAT bulletin.
3 Longitude increment in decimal form from the UOSAT bulletin.
4 the constant 360. Used for modulo 360 calculation.
5 time of equinox. Initialized from the the UOSAT bulletin in
   decimal form (hours local or GMT)
6 time per revolution (hours) in decimal form from UOSAT
   bulletin.
7 constant 24 for the modulo 24 calculation.

This is the program for a HP 33C calculator:

```
01   RCL 2     ;CALCULATE FOR NEW LONGITUDE
02   RCL 3     ;ADD THE INCREMENT
03   +
04   STO 2     ;ADD BACK TO LONGITUDE
05   RCL 4     ;LONGITUDE MUST BE MODULO 360 DEGREES
06   -
07   (g)X>0    ;CORRECT IF > 360 DEGREES (MODULO 360)
08   STO 2
09   RCL 5     ;NOW CALCULATE TIME OF EQUATOR CROSSING
10   RCL 6     ;ADD INCREMENT
11   +
12   STO 5
13   RCL 7     ;CORRECT IF >24 HOURS (MODULO 24)
14   -
15   (g)X>0
16   STO 5     ;IF >= 24 HOURS, SUBTRACT 24
17   0    ;CHECK FOR NUMBER OF ITERATIONS
18   RCL 0     ;FETCH NUMBER OF ITERATIONS TO GO
19   1
20   -    ;DECREMENT SAME
21   STO 0     ;AND STORE IT
22   (f)X<=Y   ;IF ZERO OR LESS, STOP
23   R/S  ;STOP HERE.  IF WANT ANOTHER PASS, HIT R/S
24   GTO 01    ;FOR EACH PASS, CALCULATOR WILL STOP WITH
          ;NUMBER OF PASSES DONE
```

An example of how this works is given:
On Jan. 7, the UOSAT data was given as:
Equatorial crossing @ 15:25:31 GMT and the Long. was 4.5 deg.
west. Therefore, the time was 10:25:31 EST which is about
10.425 hours decimal. This was entered into register 5.
4.5 was entered into register 2.
The period for the revolution of the craft was given as

94.787 minutes/pass which is 1.58 hours per pass. This is
entered into register 6. The longitudinal increment is
entered into register 3. This was given as 23.696
deg./pass.
Now, to find out how many times (iterations) are needed,
realizing that there are about 15 orbits per day, figure the number
of iterations as days times 15. I wanted the passes for the afternoon
of Jan. 17, which is 10 days after Jan. 7, or 150 iterations.
This was entered into register 0. Now start the program at
01 and wait. When it stops, register 2 will have 7.425 EST
and register 5 will be 318.9 deg. The angle here is too low
for any use; use anything between +- 15 deg. from your longitude
is sure to work. By hitting the R/S button once, the
time and long. registers are incremented once. Again look
at the values to see if they are within range. This single
iteration may be repeated. After four single iterations
(ie, pressing R/S four times) -4 will be displayed. The
time in register 5 will be 13.745 hours (13:45 EST) and the
angle will be 53.7 deg. One more iteration yields 15.325 hours
(15:20 EST) and 77.4 deg. Being in NJ (~74 deg W) I found that
I could hear (with only a 5/8 wave and a mobile rig which
proves that you don't need anything special) the 13:45 EST
pass (54 deg W) and the 15:20 EST pass (77 deg W).
Note that the result in register 5 is in hours decimal form.
Convert this into the normal hours:mins for convenience.
Also note that this is the equator crossing time. It takes
about 3.8 deg./min. for the craft to make its way up from the
equator, so for NJ (~41 deg N) add about 11 min. to the time
for the overhead crossing. This yielded a 15:31 pass that
WB2HJX will attest to.

Please direct any comments, etc. to this newsgroup or to me,
houxf!4313dim. Enjoy.

Scott McLellan KA2JIV

Although the phase velocity of an elctromagnetic disturbance can be greater
than the speed of light in dispersive media, it strikes me as improper or
misleading to claim that an "electric signal" can travel faster than light.
The concept of a signal is intimately related to communication, and a
"electric signal" travelling at the phase velocity (whatever that might mean)
cannot be used to relly send a "signal" (as is normally connoted by the word)
to anyone at a velocity greater than that of light.

For those with personal computers, I can recommend several good programs
to give azimuth/elevation data as functions of time for satellites such
as Uosat; if there is interest, I'll post further details.

For those who would like to use Scott's HP-33 program, I would be happy
to post equator crossings derived from the NASA prediction bulletins I
receive for the following satellites, if there is sufficient interest:

Oscar 8,9
RS 3 thru 8
Noaa 6,7

red bank, new jersey, u.s.a.
hr propagation forecast bulletin nr 3 from arrl headquarters
newington ct janqary 16, 1983
to all radio amateurs bt

major changes in solar activity have occurred in recent weeks.
there was only a slow rise and fall in the solar flux, from 136 to
170, and back down to 140. the flux was rising gradually after
january 13, but no major peak seems imminent. flux levels have been
as much as 110 points below those at the same time in the previous
solar rotation.

no large solar flares have been reported, and the average level of
geomagnetic activity has continued much below that of december. this

made for more stable long distance propagation, partqcularly on h oh
latitude circuits. the muf was lower in early january, but otherwise
dx conditions have been generally good, except for an absorption peak
january 10 and 11. there will be higher wwv a and k indices during
much of the forecast week, and conditions will bepsomewhat like those
of january to date. more stable and generally better conditions are
expected after january 22.

the solar flux is likely to average higher in the last half of
january than in the first half, but the increase will have only a
slight effect on the higher frequency dx bands. january may have a
solar flux average below that of any month in recent years.

american sunspot numbers for january 6 through 12 ranged from a low
of 67 on the 11th to a high of 110 on the 8th for a mean of 90r4 ar

> I also agree with the article(s) in favor of the no-code
> license. I am not a ham, but am interested in becoming one. In
> fact, I'd probably be one now, if it weren't for that code

requirement. I simply don't have the time right now (I am a full time student, plus I work ~20 hours a week) to sit down and learn it.

If and when I do get my license, I don't plan on using CW at all. Not because I think it's necessarily outdated or primitive, just because that end of things doesn't really interest me. Instead of requiring the code to get a license, I think perhaps they (the FCC) should simply make the written test more difficult. I looked at a "sample" novice test, and answered about 75% of the questions correctly without even knowing the answers, I just used common sense.

Perhaps the test to get a code-free license should be more along the level of a general-class test (I've never seen one, I'm just making an example), but the license should only grant the permissions given to technician-class folks. Then, I guess if they really wanted to, the FCC could require that code-free license holders take a code test if they wish to upgrade to a higher-level license.

Oh well, enough rambling. Mail any comments, flames, etc. to me, not to the net.

     having been a ham for 23 years i have some observations about no code licenses. when i became a novice the big challenge was the code at 5 wpm and ohms law. i over came both of them and felt that i had to work for it and now that i have it i want to protect it from those who would destroy it.

     The sad state of affairs on the hf bands (lids, kids, space cadets and phonetic fanatics) with all the jamming, swearing, etc. drove me to uhf weak signal work and oscar. up here we have those 'technicians' who all they know is the code at 5 wpm. well of course noboby cares because all license classes operate in harmony.

     what is the major mode for weak signal work? cw of course. the majority of eme qso's are cw, the majority of low enhancement dx qso's are cw. what does it prove? even in the highly technical world of uhf, cw is very important.

     you can have your no code license up here, but please don't stomp on my 'in the noise almost readable' signal because i am also trying to advance the communications art.

     the biggest problem will be in the test the fcc gives. if it is too difficult all the non ee types will be claiming discrimination. if it is too easy another cb band will result. just maybe a 5 wpm cw test will be perfect way to separate the men from the boys.

                              73 and good dx
                                 dan af9r
                        (....decvax!ittvax!tpdcvax!baker)

hr propagation forecast bulletin nr 47 from arrl headquarters newington ct movember 22, 1982
to all radio amateurs bt

in the past week, the solar flux rose from 162 on the 17th to 206 on the 21st. this was the highest since october 1, and it was enough to push the f layer muf over 50 mhz. thus cycle 21 became the first solar cycle in which 50 mhz was open for f layer dx in four consecutive years. generally low geomagnetic activity made recent days notable for the excellent quality of hf propagation as well.

the solar flux has been above readings for the previous solar rotation since november 5, and this will continue for a few more days. there was a major aurora the evening of november 21, degrading hf propi ion but providing an exceptional vhf auroral opening across northern usa and adjacent canadian areas. there will be more disturbances through november 29, but in between there will be good hf conditions and very likely more 50 mhz dx. at the end of november the solar flux and muf will be lower, but hf conditions will be good to excellent in early december.

american sunspot numbers ranged from 93 on the 11th to 140 on the 17th, for a mean of 109 ar

Iskra 3 was deployed from the Russian Salyut 7 spacecraft on Thursday,
18 November 1982, according to TASS, the Soviet News Agency. The birth
of Iskra 3 was very similar to Iskra 2 which occurred on 17 May 1982.
Several stations have observed the complex telemetry transmissions on
29.583 mhz. Like the earlier satellite, this one will probably be
short-lived, burning up in the atmosphere in about two months.

The following is orbital data for Iskra 3:
Catalog number: 13663
Epoch time: 82322.76294085
                 Thu Nov 18 13:18:38 1982 EST
Inclination: 51.6338 deg

Re: diagnostics for new computers, fresh out of box

Sudden infant mortality is surely a very common occurrence in the microcomputer field. Memoery tests are very useful; the best I have seen is called the Rasmussen Memory test (MEMR2) from Lifeboat and is most likely available from them for a modest fee. There are also a plethora of public domain memory tests available in the public domain and they are generally useful for "hard" errors only; I have seen several instances of bad memory where the mory tests insist that all is well. Those that exercise the memory at full speed are the best. Look at one called WORM and another called UMPIRE (both in the public domain .) I did just have ocassion to repair a CCS 16K static board on which a 2114 went bad after about 18 months of almost daily use. This is the exception.
The best way to burn in the system is to use it in normal operation intensively for a while. I find that the real life conditions will show up any faults much more effectively than the so-called test programs. If your machine runs WordStar for example, chances are that there are no problems.
I will leave comments re disk drives and other components to others who are more knowledgeable about them.

Regards,
Charlie

Subject: Re: No code license
To: Hamradio^.ES

CW is not old fashioned and is an essential requirement to be considered a real radio operator. Any dope can yack into a mike.

The reason for CW in the HF bands is (1) it is highly effective with simple equipment, (2) it is much easier to "talk" to people that do not know English, (3) the bandwidth is very small (usually less than 100 Hz as compared with 2000 Hz for sideband) which allows more stations to be on the air (4) it acts as a barrier to getting a licese so the people that become Hams are the ones that really want to be Hams.

The people that "cant" or wont learn CW are the ones that want everything easy By leaning the code, at least once in your life, you get something by really earing it.

Without the code the HF bands would become something like the CB bands with no one communicating with anyone.

Despit what is said about the effectiveness of CW vs Sideband, CW is much more effective means of communication under emergency conditions. Note that almost all Moonbounce is done with CW.

CW has the advantage of narrow bandwidth giving more effective penetration as well as a good hardcopy (I have heard sidebanders on numerous occations go to CW when they wand to send written text.

Phone is comparable with telephoning another person. CW is comparable with writting a letter. The telephone did not stop people from writting letters and Phone should not stop people from using CW.

Many people cite the Canadian Packet licese as an example, ;but it is a poor example. Only less than 200 have been insued and it may die from lack of interest. The Technician licese was started in this country to bring in all those millions of geniuses that don't want to learn 13 WPM code. They never materialized. Similarly, a code free UHF licese will not bring in many: the people that are motivated and have the technical training have already learned the code. For the others, the removal of the code barrier will not make them produce anything, and it is best to leave them on CB radio.

To: Hamradio^.ES

CW is not old fashioned and is an essential requirement to be considered a real radio operator. Any dope can yack into a mike.

The reason for CW in the HF bands is (1) it is highly effective with simple equipment, (2) it is much easier to "talk" to people that do not know English, (3) the bandwidth is very small (usually less than 100 Hz as compared with 2000 Hz for sideband) which allows more stations to be on the air (4) it acts as a barrier to getting a licese so the people that become Hams are the ones that really want to be Hams.

The people that "cant" or wont learn CW are the ones that want everything easy By leaning the code, at least once in your life, you get something by really earing it.

Without the code the HF bands would become something like the CB bands with no one communicating with anyone.

Despit what is said about the effectiveness of CW vs Sideband, CW is much more effective means of communication under emergency conditions. Note that almost all Moonbounce is done with CW.

CW has the advantage of narrow bandwidth giving more effective penetration as well as a good hardcopy (I have heard sidebanders on numerous occations go to CW when they wand to send written text.

Phone is comparable with telephoning another person. CW is comparable with writting a letter. The telephone did not stop people from writting letters and

Phone should not stop people from using CW.

Many people cite the Canadian Packet licese as an example, ;but it is a poor example. Only less than 200 have been insued and it may die from lack of interest. The Technician licese was started in this country to bring in all those millions of geniuses that don't want to learn 13 WPM code. They never materialized. Similarly, a code free UHF licese will not bring in many: the people that are motivated and have the technical training have already learned the code. For the others, the removal of the code barrier will not make them produce anything, and it is best to leave them on CB radio.

Joe N2XS

Flames indeed! I could smell this all coming. First the techies admit timidly that they never did like code and think it might not be necessary to require all hams to learn it. Then the "spark forever" chaps dive in and claim that CW is absolutely essential, that it is the most efficient use of our band space, that it is the necessary "barrier" to keep out throngs of CBers who would ruin hamming for everybody. And, yes, a final rejoinder that CW is fun and should not be done away with altogether.

What was that again? Do away with it altogethner? Who said anything about that?

We were talking about making CW an oPTIOnAL part of ham radio...like, maybe giving people a choice? What a peculiar notion...kind of like giving people a choice as to whether or not they have to join a union to keep their jobs. Unions virtually froth at the mouth when such a thing is suggested, usually claiming that making unions optional is a plot to "do away with unions altogether."

Funny how making something optional is a plot to do away with it altogether.

Maybe such an assertion is just an aggressive way of admitting that very
few people really WANT CW or labor unions, and that if optional, they
would be pitched over the rail in short order. Think about it.

Other issues: CW is the most efficient use of our bandwidth.

Nonsense. CW buys narrowness of bandwidth at the cost of throughput.
The real measure of band usage efficiency is the quantity of information
passed per second per unit of bandwidth. Measuring this accurately is
NOT trivial. I'm not sure it's ever been tried. I was a novice, and
I worked CW as long as I had to. I dropped it because it was painfully,
agonizingly slow. I pondered that speeding it up to the throughput of
a phone signal would probably make it just as wide as a phone signal.
Bandwidth increases as information density increases. Sorry about that.
The only way to increase band-usage efficiency is to be real tricky--
to pack information into the dead spots, to stop going "um,ahhhh" and
dah dididididah, dah dididididah, etc. In short, to use packet techniques,
and all the other neat stuff Bob Van Valzah might teach us if we'd just
let him in.

Now let's talk about Barriers. We need barriers to test the mettle
of prospective hams so that we don't allow the Tennesee Toilet Flusher
to Git Awn the Channul and take over. Agreed. But why CW as a barrier?
What does it buy us other than a brick wall? It buys us
dedicated hams who can pound brass. Does it buy us hams who know how to design
advanced digital filters? No. Does it buy us
hams who can define and implement really and truly efficient
modes of information transfer? No. It gives us dedicated brass pounders.
It gives us nothing to advance the art past where we're already at.
If we're to have a barrier, give us a barrier that improves the art.
I think an EE/digital barrier would be much more appropriate. I
probably couldn't pass it right now. But I would
durn well crack a book and study it until I could, figuring that in
the process I was learning something that would be of genuine use,
not something that had gotten the last ounce of efficiency squeezed
out of it thirty years ago.

More could be said, but I've said enough. A proposal, then: Make
the CW test 5WPM for all license classes to satisfy the treaties, leave
the CW bands as they are, and let N2XS and the novices do their thing.
Make the tests much tougher to keep the yahoos out. Give hams a
choice. All in favor say aye. All opposed, click your keys. Somebody
else tally it up. I gotta go back to work.

Right - but why stop there? Let's get rid of speed limit laws, and license plates for cars - who needs them either? How about income taxes - if anything ought to be optional, that's it. Seriously, if you want to join the club, pay the admission fee. For a mere 5 wpm. you can can your very own Tech. Come on guys, do you know how *s l o w* that is? You can pass that just by memorizing A through Z and doing table lookup in your mind for each letter (although that's certainly no way to really learn the code).

Sure, there's arguments on both sides, but in the time it takes you to grump about how unfair life is, you could have learned the code.

"Oh the farmer and the cowboy should be friends,
Oh the farmer and the cowboy should be friends.
One man likes to pound a key,
The other uses SSB,
But that's no reason why they can't be friends."

Subject: NO CODE LICENSSE
To: HAMRADIO^.ES

Having past my Tech exam last May after spending 20 years desiring a ham license but it off because of the code requirements I can perhaps shed some light on this ongoing discussion.

No this isn't one of those "I had to do it so everyone else should" (flames), let's face it without the code requirement I7d have had a \license over 20 years ago.

By the same token when I finally found the time to sit down and learn the 5wpm required it really wasn't all that hard with the proper instruction from an ARRL affliated club.

Now to the points I'd like to add to the discussion:

1) In reference to Pete(VE5BEL)'s fear it has been pointed out many times that below 30 MHZ a knowledge of Morse Code is required by INTERNATIONAL AGREEMENT (ITU) regulations. Therefore any no code license would be for use of frequencies above 30 MHZ.

2) In response to Dave Puree having just taken the General Class written exam in May 1982 it was very disappointing to say the least. The technical content was nil to non existent. No wonder we have general's who don't know how to cut a dipole or which end of a beam antenna directs the signal.

3) It must be remembered that with the passage of the Goldwater bill the licensening exam for all but the Extra Class will be administered most probably by ARRL affliated clubs drawing questions from a national pool (computerized) selection.

4) The only remianing question would be if a code free license is approved would it replace the present Tech with a corresponding loss of privledges below 30 MHZ? The alternative would be an entirely new license class call it (DIGITAL)

My own personal preference would be a new class (Digital) with frequency allocations to be determined for argument sake say 220MHZ and above. Prefrrably not 144 which is already extremely crowded nation wide.

This would bie those desiring to experiment and advance the state of the art a license without code requirements but limited to frequencies on the fronteer of the art for experimental purposes. On the other hand we also maintain the present traditional class structure for those who want to pursue the HF bands for DX or other reasons with the required code attachments per the International agreement.

I personally enjoy both the CW in the Novice bands for code practice and long range communications as well as my 220 repeater operation for local and home communications.

Jeff,

Why all the concern over speed of data transfer in the amateur service. Ham radio is supposed to be a hobby and as such should be relaxing and enjoyable. Life is too hurried nowadays as it is without putting rush-rush into the hobby. Slow down a little and enjoy life, don't burn out a bearing.

The comments about the usefulness of CW on HF, although I generally agree with them, aren't really relevant to the proposed no-code license.

The most likely proposal from the FCC this winter will be to drop the CW test from the Technician class license. Of course, by international treaty, the Novice CW privileges granted to Technicians in the middle 70's would have to be removed from any code-free license. Therefore, the proposal poses no threat to HF operations.

The result would be full privileges on 6m and up, excepting the segments reserved for CW only. As an aside, it is true that much, if not most, small-signal work, e.g., EME, on VHF/UHF is conducted using CW. However, it is also true that this work is usually carried out in the CW-only segments, and these would be off-limits to a code-free licensee.

The basic argument I would make to those who oppose the code-free license is this: No one is trying to deny the usefulness of CW in its proper places

or to do away with it altogether. CW is certainly NOT obsolete, and it will continue to be used both on HF and for small-signal work on the higher frequencies for a long time. Including by me. If the code-free license becomes a reality, however, it would have the LEAST effect on the dedicated brass pounders who spend all their time in the CW subbands. Therefore, I don't understand what they have to object to.

As an issue completely separate from the usefulness of CW, I do believe strongly that it is a mistake to make CW an inflexible prerequisite for doing work in entirely different facets of amateur radio. The comments clarifying the difference between bandwidth efficiency versus throughput are clearly correct. If the FCC were to require all amateurs to be proficient in the technique that results in the most efficient use of our allocations, everyone would be forced to learn packet radio, not CW!

In our crowded bands, any advances in the state of the art which could improve the utilization of our allocations is clearly desirable.
These advances are much more likely to take place with the influx of technically talented people that a code-free license would provide.
If you want a test to keep the "lids" off the bands, make it technical!

A few of my thoughts on the no code license:

1. It probably does deter people who are not serious about the hobby, even if they are interested in electronics, or digital or cs or whatever.

2. It's a well known fact that the only people who get anything useful done are ones who are serious about accomplishing the task they set out to do.

3. People who are on the outside of our hobby looking in promise great things if the code restrictions were lifted, such as lots of experimentation on packet systems, sattellite communications, etc.

4. The code (at 5wpm) is not tough at all if a person is serious and puts a few hours a week for 3-4 weeks. This is all that is currently required to obtain the privileges that these people so desire.

5. If alleged experimenters won't put forth that small amount of effort, what makes anyone think that they would do anything useful if given the privileges they want.

6. My own personal opinion is that we would just open the doors to a bunch of poor operators who would contribute a negligible amount of research to the hobby. If they havent't got the gumption to learn the code at 5wpm, then they don't have the drive to do any experimenting either.

thanks for letting me get that off my chest. Now watch out as maybe the folkIve aimed this at will prove me wrong.

hr arrl bulletin nr 106 from arrl headquarters
newington ct november 23, 1982
to all radio amateurs bt

thirty meter band users are reminded that only the frequencies 10.100 to 10.109 and 10.115 to 10.150 mhz in that band are available to the amateur service in the u.s. violators believed by fcc to be repeatedly or willfully using the frequencies 10.109 to 10.115 mhz are now being fined by the commission. during the previous three

weeks or so, fcc has warned violators with advisory notices or phone calls. however, the commission has now received an official complaint of interference from the government service which uses 10.109 to 10.115 mhz and accordingly has escalated its response. thirty meter users are further reminded that the entire assignment is temporary and is available on the basis of no interference being caused to stations in the fixed service. only a1 and f1 emissions are permitted and power is limited to 250 watts input by general, advanced or extra class license holders only ar

ad7i msg 24:

I can't help but add my comments and thoughts concerning the CW requirement controversey for amateur radio licenses.

I have vasillated several times on this issue.
However, I now think that my opinion has been finalized.
I no longer support the code-free license for the following reasons:

1) Learning CW at 5 WPM is not an undue burden for the privilidge of using the public's airwaves. It is easy. It does require a little work.

2) CW is a "language transparent" communications mode. That is, with standard internationally adopted abbreviations, I can communicate with others that do not have a spoken language in common with me.

3) Finally, and most importantly, CW is a mode that radios utilizing different modulation methods can always use to communicate. If one is AM and the other is PM, that's ok. CW is a pain to copy on an AM receiver but it can be done at 5 WPM. If a

station is causing interference on a channel, regardless
of modulation, other stations should be able to inform
him of that and he SHOULD BE ABLE to understand those
messages. Be it at 20 WPM or 2 WPM; I will be happy
to accomodate him.

I think that item 3 is the one that hits the mark.
If someone is causing YOU interference, it is not unreasonable to
expect them to be required to understand your messages telling
them to GET THE HELL OFF THE CHANNEL, QSO IN PROGRESS!
No excuses.

I am somewhat confused as to the traditional concept (i.e., I read it before somewhere more than once) of "bandwidth used = information transfer rate". Let me postulate this: A very slow CW signal is transmitted by generating an RF signal 100 Hz in bandwidth, switching it on and off once per second to make a second-long dit. This on-off switching speed is increased, assuming the transmitting and receiving equipment can handle and detect it, to ten times per second, then 100 times per second, then 1000 times per second. Instead of one-second dits, we now have one-millisecond dits, right? All along, the signal has been 100 Hz wide, because the SIGNAL has never been changed, all we have been doing is turning it on and off faster. So our information transfer rate has multiplied by a factor of 1000, but the bandwidth is unchanged. Couldn't this process continue, reducing the dit length to a microsecond, and then a nanosecond, until the pulses are so short that they cannot be distinguished from a continuous signal? The bandwidth is still unchanged, isn't it? Or is it some magic effect of the switching that turning something on and off at a higher rate will somehow increase the bandwidth it occupies? If it does, is this some effect like splatter? If so, isn't eliminating it just an engineering problem, not a theoretical issue?

Hmmm... Will Martin

I might as well put my 2 cents in also. I too was faced with a decision years ago as to which hobby I wanted to devote my time. I was interested in becoming a ham as it was different from my work. I was not willing to spend a considerable amount of time learning a needless skill as I am a klutz at skill activities and I rebelled at the code anyway. I had a 3rd class at the time and worked at a radio station.

I perked up my ears when I heard about the potential move to codeless hamming. I've been scanning this newsgroup since then.

If the majority, wish to continue the requirement for code as a badge of honor and membership into the club that is their right and I have no agrument with that mind set. However, I think I'll continue to pass until codeless becomes a reality as time is allways scarce.

The new Soviet amateur radio satellite Iskra 3 is apparently carrying a 15-to-10 meter transponder like the one carried on Iskra 2 that was never turned on. The frequencies are:

input: 21.230 - 21.270 mhz
output: 29.580 - 29.620 mhz
beacon: 29.583

The transponder was on Thursday and part of Friday (just after being deployed from Salyut-7.) However, temperature readings shot up to 50 degrees Celsius, and the transponder was shut off. Bus voltages are reading low, and the beacon power output is down to 50 milliwatts, half of its nominal value.

Since Sunday, the spacecraft has been in a simple telemetry mode. Temperatures are still about 50 C.

Envelope shaping in a CW transmitter places a limit on the speed at which
it can be keyed with the dots remaining separable at the receiver. Envelope
shaping is also what determines the bandwidth.

In the extreme case, a CW transmitter that could generate
distinguishable dots at 20,000 dots/second would be generating terrific
"key clicks" even if keyed at a much slower rate.

In order for a CW transmitter to take up the minimum possible bandwidth,
its keying envelope would have to be changed as a function of the operator's
sending speed. If the operator were to send slower, the rise/fall times
of the transmitter envelope should be made longer, and the occupied bandwidth
would decrease. Ideally, the envelope rise time should be adjusted so that the
transmitter just reaches full power at the point where the key is

released in a "dot", resulting in a sinusoidal envelope. Otherwise, bandwidth
is being wasted by communicating the rise time of the envelope faster than
it need be.

The same effect is true in narrow CW filters for receivers. If one uses
too narrow a filter (assuming the receiver remains stable), fast CW
would come out as a blur. Any filter will spread out the rise and fall
times of the signals passing through it.

I obtained my novice ticket within the last month, and within a couple
weeks I'll trek to Chicago for a 13 wpm code and General written exam.
I am in favor of maintaining the code elements for amateur licensing.
I don't know (yet) if I'll continue to use CW after I get my General but
it is a skill that might prove useful in the future, and currently is
a factor in maintaining a good level of ops on the low bands. I don't
consider it any different than anything in life. Each thing that
we do (like college,job,hobby) has a hoop, and if we want to reach the
final goal we must jump through the hoops.

I thoroughly agree with the article in favor of the no code license.

I have been licensed about 11 years, 9.5 as an Extra. I do enjoy using CW on the HF bands, even though I was one of those who said "I just want to be able to talk" before I got my first license. However, I feel that state-of-the-art technical capability is FAR more important (and far more lacking, unfortunately) than Morse Code capability in the Amateur service, and that knowledge of CW is often irrelevant to many of these technical areas.

I have often asked technical friends who are interested in the practical aspects of communications why they don't get an amateur license. The replies are usually along these lines:

1. "I don't want to learn the code; I just want to experiment with [packet|satellites|microwave|etc]."
2. "Why should I want to be part of a service that still uses Morse Code?"
3. "Nobody does anything technically innovative in the Amateur Service."

When you think about it, these three reasons are circular. Opportunities for major technical innovations are missed because many technical types aren't hams. Many technical types don't become hams because they don't feel learning CW is worthwhile. CW is still used because there haven't been technical innovations (and the acceptance by the amateur community) to replace it.

The surest way to break this cycle is to introduce new blood by removing the CW requirement. I'm not sure that making the written test harder is the right thing to do; the purpose of the test should be to make sure that the operator has the technical expertise and understanding of the rules to operate his station safely and prevent interference to others. The FCC has also shown that it is incapable of producing tests that are truly relevant, up to date and a good measure of an operator's technical expertise.

The biggest threat to our amateur allocations come from competing interests who point out the underutilization in our higher bands. The surest way to protect these bands is to use them, and the best way to use them is to bring in new amateurs who will use them.

The bandwidth of a CW signal is 4 times the words per minute (5 letters/word not 4 letters/word as in Canada and England). As the information rate is increased the bandwidth goes up .... a law of physics and not a thing that can be eliminated. The confussion in these types of arguments is the fact that you mix the time and frequency domain. In the frequency domain there are only sidebands and carriers that never change in time. In the time domain there are only carriers that change in amplitude. The components in the frequency domain always add up to what you get in the time domain (fourier transform). In the case of CW the unvarying components in the frequency domain add up to a signal in the time domain that goes on and off. The components in the frequency domain do not go on and off when keyed.

The frequency domain is what you get when you tune across a signal with a receiver of bandwidth much much less than the signal bandwidth. The time domain is what you get when you tune across a signal with a bandwidth much wider than the signal bandwidth. In reality we are always between the two. Usually you set your bandwidth to be just a little bigger than the signal so the output is in the time domain but not so much in the time domain that you get a signal you don't want.

If a dit becomes a microsecond then the bandwidth is about two megahertz or a little more and you occupy two megahertz of spectrum. The FCC doesn't like that although the Germans did just this during WW2 in sending to their subs. They sent CW in a burst, recorded it and played it back at a low speed so the operator could copy it.

The faster you switch on and off the wider the bandwidth. If you restrict the band width you lose information. In other words Shannon's formula:

Signal bit rate/Bandwidth = log(base 2) (signal/noise +1)

If you send more information you need more power or more bandwidth. This is a fundamental limit of nature for which there is, at present, no way of getting around.

The people in favor of a code free licese have several arguments which I consider invalid. Some of these are:

1. CW is "Just another mode" and should not be forced on people that do not want to use that mode.

If ham radio was like any other hobby then you are at liberty to do what you want. But ham radio is not. Its fundamental purpose is public service. We are using a national resource ... spectrum space. If its just to amuse ourselves then we could do anything. But The reason you have your licese is because it contributes to the good of the nation. In particular disaster communication. I cannot see how anyone that pretends to be contributing to the public service can call himself a radio operator without being able to send and receive CW.

CW, on HF or UHF can get through under most adverse conditions. Recently a boating accident left a boat sinking on the Pacific near San Francisco. The mike was smashed in the accident but the guy knew CW because he had leaned it as an Eagle Scout many years ago. He was saved because a Ham operator that knew CW was listening on the CB band.

Also CW has been sent by waving flags, flashing flashlights, tapping with pipes, etc.etc.etc. In a submarine disaster code was sent to the men inside and back by tapping a pipe ... one bang for dots, two bangs for dashes. Many lives have been saved because of a knowledge of CW both on and off the bands. Also, in times of disaster on a wide level, most communication is by written message. This can be more accurately and faster sent and received by CW.

2. CW is an unnecessary restriction and is just "too difficult to learn".

It takes a person of average intelligence about 4 hours to learn and send and received at 5 WPM. After leaning the code it takes about 30 minutes practice to get to 5WPM.

3. CW is not necessary on the UHF bands.

In the future it will even be more necessary. As the space shuttle builds a space station, exploration to the planets and beyond will take place. QSO's by hams will be at first by CW because of the simplicity and effectiveness. Also, emergency communication with people in space, via the Hams on Earth would be greatly hampered without CW. How would you feel if the first distress message from space was sent via CW and there were no hams that knew how to copy it ? Remeber that boating accident.

Joe, N2XS (spark forever !!)

Just out of curiosity, does anyone know anything about the
function of the signal on 10.112 MHz (the reason for the
"30-meter gap"?

                  Dan, K1DK

The bandwidth of a CW signal is 4 times the words per minute (5 letters/word not 4 letters/word as in Canada and England). As the information rate is increased the bandwidth goes up .... a law of physics and not a thing that can be eliminated. The confussion in these types of arguments is the fact that you mix the time and frequency domain. In the frequency domain there are only sidebands and carriers that never change in time. In the time domain there are only carriers that change in amplitude. The components in the frequency domain always add up to what you get in the time domain (fourier transform). In the case of CW the unvarying components in the frequency domain add up to a signal in the time domain that goes on and off. The components in the frequency domain do not go on and off when keyed.

The frequency domain is what you get when you tune across a signal with a receiver of bandwidth much much less than the signal bandwidth. The time domain is what you get when you tune across a signal with a bandwidth much wider than the signal bandwidth. In reality we are always between the two. Usually you set your bandwidth to be just a little bigger than the signal so the output is in the time domain but not so much in the time domain that you get a signal you don't want.

If a dit becomes a microsecond then the bandwidth is about two megahertz or a little more and you occupy two megahertz of spectrum. The FCC doesn't like that although the Germans did just this during WW2 in sending to their subs. They sent CW in a burst, recorded it and played it back at a low speed so the operator could copy it.

The faster you switch on and off the wider the bandwidth. If you restrict the band width you lose information. In other words Shannon's formula:

   Signal bit rate/Bandwidth = log(base 2) (signal/noise +1)

If you send more information you need more power or more bandwidth. This is a fundamental limit of nature for which there is, at present, no way of getting around.

The bandwidth of a cw signal is determined by the formula:

Bw = BK

where Bw is the bandwidth in Hz, B is the baud rate, and K is a
fudge factor given as 5 for fading circuits. Thus, the common
bandwidth of 100 Hz for a cw signal is actually at 20 baud.

Anyway, on-off keying is a form of modulation (actually 100% AM)
so the keying speed is equivalent to the modulating frequency.
Like any AM signal, then, the higher the modulating frequency,
the wider the actual bandwidth. Thus, a 600 baud cw signal would
require about 3 kHz bandwidth (same as a SSB signal).

Yes, there is a theoretical reason why increasing the rate at which
a "pure" RF carrier is turned on and off MUST increase its bandwidth.
The branch of mathematics/engineering which makes this clear is

Fourier analysis.

I think it makes sense to cut power to 250 Watts:

1) On 20 meters and above it doesnt help you

2) on 80 and 40 it is used to blast out the other stations.

If you cut power, they would still be blasting each other but at a lower level.

Remember the DB loss is only 20 log(1000/250) = 10 db or about 2 "S" units.

Running CW at 0 w.p.m ideally gives you a bandwidth of zero hz (Awful
clean, stable xmtr). When you key it, you are modulating it, producing
sidebands. If you increase the w.p.m rate, the bandwidth increases. If

your transmitter doesn't "waveshape" the keying action
then the bandwidth increases much in the way the modulating square wave
has a bandwidth wider than it's fundamental. At 20 w.p.m. (assuming
suitable "waveshaping") the bandwidth is still under 100 Hz or
so. By the way, bandwidth does not determine the information transfer
rate, it only limits it. Human voices (like in SSB mode) are not
efficient in bandwidth use. In the second I might say "hello", I could
send 120 characters with my 1200 baud modem that uses the same (or
smaller) bandwidth . It would take some three seconds to send that using
CW at 20WPM, but at 1/25 the bandwidth, yielding a net 8 times better
use of bandwidth. Further, sending English language by any mode
also cuts down the information transfer rate -- English contains much
redundancy. An obvious example of this is your *NIX "compact" program.
You can make a text file 30% smaller WITHOUT loosing any information
content (it can be converted back, can't it?).
For more detailed, and exact numerical representations, get hold
of a fellow "into" Coherent C.W. -- They operate with VERY narrow
bandwidth, such that you can pull out copyable CW when you have
a noise to signal ratio (>1).

It seems that lots of discussion of the code-free license is influenced
by HF concerns and HF crowding. (By the way, I thought the Technician Class
essentially IS our code-free ticket for those interested in experiments
in VHF, etc. 5wpm certainly isn't proficiency and really isnt much of
a barrier!). My argument isn't cw or no cw, but another subject-
lets reduce the 1KW limit on power input to transmitters.

Now realistically, 250 watts should be quite sufficient in todays world
of fine receivers. I think that 100 watts DC input to the finals
would be sufficient, but that would outlaw too many transcievers out there
today. This rule change would lead to more attention to quality of antennas,
and receivers, and make civilization arrive on 20 meter phone (I hope).

Yes, it might mean the end of vaporizing the sparrows standing on your
antenna, and it might mean the end of 25 kc wide channels to outer
ubangi land (with 500 hams calling at once). But to those users of
the HW-8 (I used to have one) and the Argonaut, and other QRP rigs,
it would mean that other hams would discover that power is not the
answer. Patience, operator skill, and quality of antennas are all
parts of the solution. Lets push for power reduction on the air.

Pleased to meet you ! Glad you responded.

It was never intended that CW be condisdered a replacement for other methods of
modulation. My letter made it clear when all else fails that CW can get
through. It is the simplicity of Cw that makes it necessary as the final back up
system.

Any system of communication is swell with me, and I really believe in the
progress of all forms. However, when the chips are down, a knowledge of CW
often, and not in isolated incidents, means the difference between life and death.

The ethernet is a swell system and works well and fast as I sit in this dry office

with plenty of 120 volts power. But what if I am on the road, in the wilderness etc., ? What if you were that guy on the boat going down with a smahed mike on the CB rig ? By the way, he sent his latitude and longitude not just an SOS.

Further more you have a distorted picture of just what radio is, let alone ham radio. The first thing to learn is that radio (all forms) is not the world communication system. Cable is. The fundamental communication of the world, now and will be for decades to come, is Cable. Radio is reserved for communication that cannot be sent over Cable (like the ethernet). There is not enough spectrum space avaiable for all the computer fans etc.,and Ham radio should not be used to fullfill this need. The light pipe will eventually be the cable between home computer hobbyists.

Ham radio is still the forefront of the development of Radio communication. All modes of communication by radio with the single exception of Back scatter and sattelite communcation, were developed by Hams. Incidently, I see that the military plan to use meteor trail communication as a backup in case the communication sattelites get shot down. This mode was discovered and developed by Hams.

As far as the universallity of CW, it is still much easier to communicate with people that do not speak English with Morse Code, having done both myself in my 29 years as a Ham. In fact, such contacts are common on CW and very unusual on SSB. As far as ASCII goes, remember, most hams outside the US have no such equipment.

The future of Ham radio belongs to those who prepare for the future. A knowlege of CW, as the final back up system, is manditory for good radio operators, not appliance operators.

I suggest that if there are so many geniuses (computer or otherwise) that, being a genius, they would have no trouble at all in leaning Morse at only 5 WPM.

Joe N2XS   Spark Forever !!!

PS, My I.Q. is 155, I work on computers, and I leaned the code. Maybe you should program one of your computers to teach you the code.

QRP is FUN!!!!!!!!!!!!!
Try working dx using low power it can be done, especially on CW.
Phone also works. I've been using a converted CB rig on 10m for
the past two years (about 25 w input, 5 to 12 out) both mobile
and fixed. There are few greater pleasures than dx'ing using
a low powered rig into a simple antenna while crossing the
George Washington Bridge in rush hour traffic.

Try QRP and CW. You might enjoy it.

At first, I was surprised to see so many people supporting
the code-free license and few opposed; I can see that within the
past week or so, the opposite side has been heard from.

I would like to make a few "reply comments" to some of the
points that have been used against the code-free license.

1. "CW is useful in small-signal conditions."

NO ARGUMENT! I frequently use CW in exactly such situations, and would
recommend that anyone learn the code voluntarily for just such use.
My biggest interest within amateur radio is satellites, and
CW is quite useful there. Half the passband on Oscar-8 is generally CW,
as is the spacecraft telemetry beacon. It is precisely the usefulness and
simplicity of CW that will keep people voluntarily learning it for some time.

2. "CW is the ONLY mode useful in small-signal conditions, and THE most
'efficient' modulation mode."

This one is a MUCH less clear. Paul Newland, in a recent report to the FCC regarding his AMTOR activities conducted under an STA, said, "CCIR 476-2 ARQ coding is VASTLY superior to conventional RTTY coding. CCIR 476-2 displays an amazing robustness during conditions of propagation that render SSB *and CW* [emphasis added] modes of communications virtually useless..." It does indeed appear that automatic error correcting and detecting codes implemented by computer can perform very well in marginal conditions. It has only been the lack of more experimentally minded amateurs such as Paul which has kept these techniques from being widely used in the amateur service. AMTOR, like packet radio in general, was invented outside the amateur service. As to spectrum efficiency, any textbook on communications theory will show you that many digital modulation and coding techniques are much more efficient both in bandwidth and in power than on-off CW keying.

3. "Anybody can learn the code in X amount of time. All it takes is a little effort. If they don't feel like learning the code, they aren't motivated enough."

The same can be said for learning electronics and communications theory. If one is to spend a fixed amount of time learning a choice of skills, it would seem reasonable to spend it doing those with the biggest "payoff." Much of the technical knowledge I have learned in hamming has been of direct use in my professional life, perhaps a larger percentage than the knowledge I obtained in my college courses. Experience from hamming enabled me to obtain a First Phone, with which I worked my way through college during summers at a television broadcast station. However, I have never "pounded brass" for money, nor do I ever expect to. Try comparing the relative numbers of FCC commercial radiotelephone and radiotelegraph license holders.

I AM uncomfortable with merely doing away with the Technician code test. I think the written exam should be expanded to require an equivalent amount of effort for preparation that the code would have required, for the "average" beginner. It would take less preparation for a person already skilled in electronics and communications technology, but it would ensure that an amateur is capable of operating his station safely and without interfering with others. In any case, the test should not be capable of being crammed for with the Bash books, but should require real understanding of the material. If I have any reservations regarding the codeless license, it is the ability of the FCC to create such a test.

4. "If I can learn the code, you can too." This is a slight variation on the "If I had to learn the code, then you should too" theme.

Unfortunately, this is an emotionally based argument, and similar to the one many fraternities use to perpetuate hazing. Each requirement for a privilege should be evaluated (and re-evaluated) on its own merits, and not based solely on tradition. Technology continuously evolves, and requires a willingness to change in order to maximize its benefits.

Every ham or potential ham has different motivations for getting involved, and it takes maturity to accept that not all persons place the same amount of importance on the things that you do.

5. "CW is a 'universal' mode of communication, one that all amateurs should have in common."

This is the only argument I have a hard time refuting. Paul Newland suggested that knowing CW makes it possible for any radios to communicate, and to identify sources of interference. Not all amateur transmissions are identified in CW (only CW and RTTY QSOs, and repeaters in general.) I also challenge you to copy CW even at 5 wpm on an AM or FM receiver! There is a case, however, that exotic modulation techniques, e.g., packet radio (some consider RTTY "exotic") should continue to be identified in CW; I think that there is still good reason for this. However, automatic identifiers are capable of reliably generating CW IDs. If one wishes to identify an interfering station, one would then have a practical incentive to know CW! However, the interfering operator is probably not likely to be any more aware of being the source of interference by being able to copy CW; after all, if he/she is interfering, then he or she is transmitting and is unlikely to be able to hear any complaints! Seriously, the rule should be, "if you hear anything, even (especially?) if you don't understand it, then don't transmit!" However, I'm sure you can cite many instances in which even CW-knowledgeable hams ignore this rule...

6. "Amateur radio's purpose is public service, and CW is essential for disaster and public service work."

This is a non-sequitur. In my early hamming days (during high school) I was an active member of the local Civil Defense organization and spent time with the local 2-meter club providing communications for walkathons and other public events. In both organizations, the predominant mode was FM phone, which served our needs quite well. I was on a CW kick at the time, preparing for my Extra, and was disappointed that I could not find a "practical" use for CW in these activities. If there was a skill lacking among the CD operators during the monthly drills that really hampered communications, it was the ability to type on the RTTY machine!

I am aware of the many stories about lives that were saved because of someone's knowledge of the code. However, how many lives could have been saved in situations where a nearby person could have been a ham with a 2 meter HT, but wasn't because he couldn't be licensed without knowing the code?

Amateur radio can perform public service in many ways. Directly, through the provision of emergency and backup communications, and indirectly, by promoting the advancement of the radio art and by providing a training ground for electronics and communications experts, free of cost to the public. It is this indirect form of public service in which we could be doing so much more. New communications technologies, e.g., satellite and packet radio, certainly contribute heavily to this latter form, and will also provide much of the direct kind in the future. If we are to retain our frequencies, it will be on the

basis of having met our "basis and purpose" (97.1), not on how many
people know the code.

Part of our problem is that amateur radio isn't a unified, monolithic
hobby. It is rather more like a loose formation of related, but specialized
activities flying together. We should be able to make this diversity an
asset, rather than a weakness, by accommodating different interests without
pitting one faction against another. Allowing "fresh blood" into the
hobby with interests that might be different from yours should not be
seen as threatening; there will continue to be much diversity in amateur
radio, and opportunities for exposure to this diversity should
be encouraged and not forced. I personally think the greatest things
to come along in amateur radio since SSB are satellites and packet radio;
however, I would rather see newcomers to these areas come by choice
and not by force. If amateur radio is a change from what you
do at work and packet radio, for example, is too close to "real work"
to be fun, fine! Nobody will force you to use it, and no one will
take your existing CW privileges away.

I feel that the code-free license, with proper safeguards such as a
competent technical exam, will be a positive, healthy step for amateur
radio.

It is not just isolated instances where CW has pulled the fat out of the fire
for radio ops. I about 4 years of search and rescue work in New Mexico, I can
remember at least 3 times that 2M HTs had their Mikes go out, and the hams used
touch tones to send their messages in CW, sometimes life-saving due to
the finding of injured victims, etc. Maybe the cold and snow contributed to
the loss of crystal mike elements, but the CW contributed to the timely arrival
of the team doctor. By the way, CW also served to keep relatively private
information

from the press, who often were listening to the progress of searches on scanners.

The people in favor of a code free licese have several arguments which I consider invalid. Some of these are:

1. CW is "Just another mode" and should not be forced on people that do not want to use that mode.

If ham radio was like any other hobby then you are at liberty to do what you want. But ham radio is not. Its fundamental purpose is public service. We are using a national resource ... spectrum space. If its just to amuse ourselves then we could do anything. But The reason you have your licese is because it contributes to the good of the nation. In particular disaster communication. I cannot see how anyone that pretends to be contributing to the public service can call himself a radio operator without being able to send and receive CW.

CW, on HF or UHF can get through under most adverse conditions. Recently a boating accident left a boat sinking on the Pacific near San Francisco. The mike was smashed in the accident but the guy knew CW because he had leaned it as an Eagle Scout many years ago. He was saved because a Ham operator that knew CW was listening on the CB band.

Also CW has been sent by waving flags, flashing flashlights, tapping with pipes, etc.etc.etc. In a submarine disaster code was sent to the men inside and back by tapping a pipe ... one bang for dots, two bangs for dashes. Many lives have been saved because of a knowledge of CW both on and off the bands. Also, in times of disaster on a wide level, most communication is by written message. This can be more accurately and faster sent and received by CW.

2. CW is an unnecessary restriction and is just "too difficult to learn".

It takes a person of average intelligence about 4 hours to learn and send and

received at 5 WPM. After leaning the code it takes about 30 minutes practice to get to 5WPM.

3. CW is not necessary on the UHF bands.

In the future it will even be more necessary. As the space shuttle builds a space station, exploration to the planets and beyond will take place. QSO's by hams will be at first by CW because of the simplicity and effectiveness. Also, emergency communication with people in space, via the Hams on Earth would be greatly hampered without CW. How would you feel if the first distress message from space was sent via CW and there were no hams that knew how to copy it ? Remeber that boating accident.

FORGIVE ME FOR ADDING THE 256th OPINION IN THAT MATTER.....

1. It's like assembler programming - you should have done it once.
   Otherwise you hardly can name yourself a 'ham'.

2. Many of those who complain about it, are not quite serious about
   ham radio anyway - otherwise they would just go ahead, learn it and
   decide AFTER THEY HAVE LEARNED IT whether they like it or not.

3. It is the old question - do you 'gently force' people to widen their
   horizon ....

4. I have to confess - my first licence was without CW (WGermany has
   such a licence for many years) - but I eventually graduated......

5. Funny but true (and beyond straight forward reasoning) - CW indeed
   keeps many unquailified people from becoming hams.
   In WGermany - there is a notable difference of the people
   on 2m and higher frequencies (the majority without CW exam) and
   those on the 'low bands'.

Thank you Phil - KA9Q/2. I too support the concept of a code free license for people interested in "exotic" communications techniques if they are required to show a technical proficiency in this area above and beyond the regualr Ham requirements and they were restricted to 220 Mhz and above. In fact I would like to see the regular ham exams updated and expanded.

The argument that knowledge of code has saved many people's lives is to a certain extent an emotional one since in most cases the mechanism of communication was not ham radio. In that case all citizens should know the code and even more lives would be saved. We could make it a requirement that you must be able to receive 10 WPM in order to get a Social Security number.

Yes 5 WPM is easy. It only took me 1/2 hour per night for three weeks to send and copy 7 WPM (thank you W1AW), but I know friends of mine who, for various reasons, wound up taking over a year to get the proficiency neccessary for a tech license - ARGHHH. It's all rather meaningless if all they are interested in is computer communications, packet radio and electronic mail.

Flame over, please also enter my name in to the net call book.

There is an article on page 55 of the December, 1982, QST written by Vic Clark, W4KFC, President of the ARRL, on the subject of code free licenses. I probably don't have to tell you it's anti-code-free. I will not summarize the article, but he makes a few major points:

[The following, labeled with *'s, are taken directly from

the article --Adam]

* An orderly growth of the US Amateur Radio Service -- perhaps
  at a rate of 7 to 8 per cent per year -- is desirable

* New ways need to be found to attract intelligent youngsters to
  this rewarding and educational avocation.

* The Amateur Radio Service, which has long enjoyed a reputation
  as orderly and efficient in its use of the radio spectrum, must
  continue to deserve that distinction.

Among his arguments again the code-free license, he says:

* It is a unique, intimate, concise and effective communications
  skill employed throughout the world.

* It is the most efficient mode in terms of power required for
  long distance communication, least susceptible to interference,
  and conserving of the radio frequency spectrum.

* It involves no accent or pronunciation problems, providing a
  widely understood international language.

* It employs simpler, more reliable and easily maintained equipment
  than any other communications mode.

* It is an equalizer, negating age, speech impediments and dialectical
  differences; it provides for ready acceptance of youngsters in an
  adult environment.

* It is the ONLY radio communications mode that is understood readily
  by both man and machine.

I have a very old VuCom I terminal, and would like to find a
memory board for it. The basic terminal has an 8x80 screen
(that's right, only 8 lines - CDC built them, years ago).
The memory card doubles it to 16, which these days would make
the terminal barely tolerable. Has anybody built memory cards
for these using current technology? It ought to be only a few
chips, but I would rather find a design which works than try to
design it. Any ideas? or pointers? Thanks.

re: Code free, Ed , KC7AK

One short comment on your code free licese message:

If the people that get their licese are only interested in packet radio, computer communications, and electronic mail then they do not belong in Ham radio.
Ham radio exists solely for public service and has little other justification. It is
essential that all Hams, to be Hams, are trained for that last ditch stand that can
be offered by a flood, huricane, etc.

There is no room in Ham radio for people that wish to reep the benifits without developing the skills for disaster work. The fact that 300,000 Hams are licesed in
the US, and can all (supposidly) send and received CW at some minimum level,
is the greatest disaster preparedness you can have. Do you wish to do away
with this and have Hams that can only push buttons on computers ??

What happens when the lights go out and all you have is .... ????
Do you call that a justification for Ham Radio ? The feds would take over our frequencies for their own version of disaster if it were.

qst de ad7i
hr propagation forecast bulletin nr 49   from arrl headquarters
newington ct december 6, 1982
to all radio amateurs bt

the slow solar flux rise predicted for about december 3 in last weeks
bulletin turned out to be a fast rise beginning the 2nd. it brought
the solar flux from 171 to 216 by the 5th. this new activity is in
an area of the sun responsible for the november low of 139. on the
5[error] flux was 71 points higher than at the same sun position in
november.

overcast skies in the northeast prevented visual observation of the
sun, but previous experience indicates a peak about the 6th or 7th.
this would put the flux high enough for more 50 mhz f layer dx,
through about the 9th, and many hours of dx on 28 and 21 mhz during
the forecast week. intermittent geomagnetic disturbances will bring
increased absorption and fading on lowe frequencies much of the
time. look for enhanced north south 50 mhz propagation and possible
enhancement on other transequatorial paths at times when the wwv k
index is 3 or higher.

a special bulletin will be issued ahead of the usual weekly schedule
if results of daily solar observations warrant ar

Re: Code-free licensing: Epistle #3

You have missed the fundamental arguments.

1) The elimination of the code requirement will not bring in all the new blood and geniuses that will revolutionize Ham radio. The facts:

a) the Canadian Digital licese has only been issued to less than 200 people.

b) The Reduction of the code for technician class at 5 WPM was for the purpose of bringing in all those people that would populate the UHF. The Technician Licese turned into a waiting room untill you get your general, the geniuses never showed up.

c) In Japan, a code free licese for 2meters made 2 meters into a Citizen's Band just like in the US. There was never any great technical upswing. If anything, Ham radio was worse off because of all the clunkers they picked up .

So forget the genius argument. The geniuses already have liceses.

2) Code is not "just another mode" to be equated with the others on an equal basis. It is the mode that gets through when all else fails. The distress situations
were only quoted as dramitization of the idea. When your mike is broken, your TTY doesn't work, etc., the code is the last resort.
remember Ham Radio is not just another hobby, it is based in pulic service. Public service justifies its existense. Without our ability to communicate in times
of disaster, there would be no Ham radio, or at, least, we would not have the spectrum space we do have. I cannot see how a person without code, even though he may not use it, can participate in a disaster with confidence. It would bother me no end if I knew that if my SSB demodulator failed, the mike

broke, etc., I could not communicate.

I agree the CW is not the most efficient mode when compared with several other modes in use. But these comparisons are really not a valid argument:

1) These other modes assume the existence of some elaborate equipment, usually including digital circuitry. Modulating CW with similar circuitry (phase shift CW for example) can place it on an equal basis since CW is another form of modulation that can always be substituted for the modulation in use (example, the ASCII code can be substituted for the CW code). But, and this is the big but, CW is human readable. I know of one person that can read Baud TTY code by ear (at 30 WPM , he could only read every other letter). I know of none that can use any other code. I know of 300,000 that can read CW.

2) When the chips are down, if you want to send CW, all you need is 1 (ONE) transitor, some wire, and a battery. (no receiver). Can oany other mode do the same ?

Compare it to a trip in the wilderness: you do not need to make a fire by rubbing two sticks togeather, you can bring a cigarette lighter. But what happens when the cigarette lighter fails ?

Chances are that you will never have your life saved by knowing CW, But, how many lives will be sacrificed by eliminating the CW requirement. A few?... A Hundered ? ....
What happens when the guy in a flood area looses his mike or rig, and only has his grid dip oscillator to communicate ?
An old tube type ACDC receiver has enough spunk in its local oscillartor to communicate on 160 meters. (The Germans, during WW2 used to pick up thoses oscillators for a distance of 100 miles and zero in on convoys).

Also, if you think CW is so old fashoned and unnecessary, remember that the final back upo system for communication to trident and polaris subs is CW on 300 Hertz (thats right ,CW on 300 HERTZ). No other system will work (all other systems take too much bandwidth). All Navy opoerators are still trained in CW and there will be no change in the future despite satellites and backscatter.

There is no question in my mind that a Ham without a knowledge of CW , even at the low rate of 5 WPM, is a detriment to Ham radio's purpose as public service, and represents a lowering of the ability and competance of Hams the world over.

REPORT TO THE FEDERAL COMMUNICATIONS COMMISSION ON EXPERIMENTS CONDUCTED BY PAUL NEWLAND AT AMATEUR RADIO STATION AD7I USING THE ERROR CORRECTING PROTOCOL DESCRIBED BY CCIR RECOMMENDATION 476-2

ABSTRACT

This report outlines the use of the teleprinter code described by CCIR Recommendation 476-2, also know as AMTOR, by amateur radio station AD7I. Use of this code during the period provided by Special Temporary Authorization (S.T.A.), file 7130, was hampered by external influences. No "scientific" data were collected but outstanding performance provided by the CCIR 476-2 coding was observed by the operator on numerous occasions.

The report concludes with a recommendation that use of CCIR 476-2 coding by U.S.A. radio amateurs be allowed as soon as possible.

DISCUSSION

This report describes use of the error correcting protocol described by CCIR Recommendation 476-2 at my amateur radio station, AD7I, during the period of May 1982 to November 1982. During much of the experimental period, the High Frequency (HF) station was inoperative because of radio problems. Additionally, I was required by business commitments to make several unexpected and lengthy trips during the fall. Consequently, time did not permit scientific data, per se, to be collected for presentation. However, I have formed strong opinions about the usefulness of this mode of communications based on my use.

In May of this year I completed construction of a microprocessor system to convert the CCIR 476-2 signals to international telex teleprinter code. The firmware to accomplish this code conversion was provided by Mr. Peter Martinez, G3PLX; I designed the controller to be software compatible with Mr. Martinez's firmware. An additional microprocessor system was designed and built by me using a different manufacturer's microprocessor. I programmed this second microprocessor to convert CCIR 476-2 Mode B to international telex teleprinter code. I also purchased a new HF-SSB radio to perform experiments with CCIR 476-2 coding. All other equipment was previously on hand.

After completing the controllers, U.S. Coast Guard and Canadian Coast Guard weather broadcasts were monitored to observe the print quality of Forward Error Correction (FEC) mode B communications during normal HF propagation conditions. In my opinion, without scientific data to back my

claim, I feel that the FEC mode of operation for broadcast use is superior to that of conventional stop-start unprotected teleprinter transmissions (RTTY). A major advantage of CCIR 476-2 coding in FEC mode is that detected errors are converted to space characters by the code converter. Hence, errors are easily and quickly spotted by the operator so fills can be made from context.

On June 1, 1982, I advised the Commission's field office that on or after June 11, 1982, station AD7I would begin transmissions using CCIR 476-2. On June 13, 1982, contact was established with station TI3DJT using the Automatic ReQuest for repeat (ARQ) mode A. From June 13 to 29, 1982, 39 contacts were made with radio amateurs around the world using CCIR 476-2 coding. Most of the contacts were made with ARQ mode A; only several contacts were made using FEC mode B. All contacts took place on or near 14.075 MHz. Stations with which communications took place were: TI3DJT, PA0RYS, HB9AUK, HB9AK, K4PA, G3PLX, A4XFW, G3RYS, KB6BT, KC7KK, and TI2CC. On June 30, 1982, the station's radio was returned to the manufacturer for repair under warranty. The synthesizer provided unreliable operation after the radio had been on for several hours.

On September 28, 1982, the radio was returned in good working order. >From September 28, 1982, to November 14, 1982, another 31 contacts were made. In my opinion, again without scientific data to back my claim, performance using CCIR 476-2 ARQ coding is VASTLY superior to conventional RTTY coding. CCIR 476-2 displays an amazing robustness during conditions of propagation that render SSB and CW modes of communications virtually useless. I apologize for not having scientific data to back my claims; I am sure that the data would substantiate my opinions. CCIR 476-2

consistently provided communications during short and long duration frequency selective fading, during SSB and CW co-channel and adjacent channel interference, and during conventional Radio Teleprinter (RTTY) interference.

The only interference to which CCIR 476-2 is not immune, as one might expect, is another co-channel CCIR 476-2 station. Such stations did not present much of a problem during the test period. However, it is important to note that there were few stations available to cause inadvertent or deliberate interference.

IMPLEMENTATION

CCIR 476-2 proves to be a simple addition to an amateur radio HF RTTY station. Figure 1 shows how the system components were configured at station AD7I. The cost of the CCIR 476-2 code converter was about $40.00 due to a well-stocked junk box. If all components for the controller were purchased new and the firmware was free, the cost for a code converter should still be well under $85.00. This is a small amount of money compared to other system components. Vast sums should not be required to implement a CCIR 476-2 code converter.

CONCLUSION

The performance provided by CCIR 476-2 coding is superior to conventional coding, and the incremental cost to add that capability to an amateur radio RTTY station is low. I therefore recommend that the Federal Communications Commission allow, as soon as possible, the use of CCIR 476-2 coding by radio amateurs who now have RTTY privileges.

Respectfully submitted,

Paul Newland, licensee of
Amateur Radio Station, ad7i

One more little bit of rambling on the subject, then I'll go away.
I personally do use CW when I operate (not exclusively, but competitive with
my phone usage). I do it for reasons varying between the fun of it and the
fact that I got New York from Washington State with a 10 watt transmitter (on
phone, it would have been significantly more difficult (NOT impossible)).

If you want a way of using radio without knowing code, why must it be an "Amateur
Radio License"? Why not a separate radio class for computer/digital packet
phreaques? It seems that that might be the better thing to do (geez, some of the
new bands could even be shared with UHF ham bands--it certainly won't be a totally
new occurance).

Blah, blah, blah...

       _3_0__M_e_t_e_r_s_.

       All U.S. amateurs are reminded to avoid the 10109 to 10115

kHz segment of the new band. Contacts on the 10 MHz band will not be creditable toward ARRL awards.

_C_h_i_n_a_.

BY1PK was active during last weeks CQ WW CW Contest working Japan and North America on 21150 kHz cw, but worked very few stations. There has been no sign of BY8AA in the lst few days.

_A_f_r_i_c_a_.

Many African stations are taking advantage of good low band propagation lately. Look for 5T5TO, 5H3BH, 3V8AL, 5Z4CS, TR8DX and TN8AJ.

_D_j_i_b_o_u_t_i_.

A recent visitor to Djibouti is F6BFN who is currently signing J200BL. QSKL via his home call.

_1_6_0__C_o_n_t_e_s_t_.

Many stations plan to be active this weekend for the ARRL 160 Meter CW Contest including a major effort by K5NA operating from KV4FZ.

_T_a_n_z_a_n_i_a_.

5H3BH continues, operated by Leif, SM00AJU, and John, SM00DJZ. They will be looking for European stations on 40 and 80 meters from 2100Z and U.S.A. from 0130Z.

_M_o_n_g_o_l_i_a_/_Z_o_n_e__2_3_.

Walt, JT00GM, continues active from Mongolia with an excellent signal on all bands, 80 through 10 meters ssb and cw. Walt has now been worked by East Coast U.S. stations both long path and short path on 80 meters. Check 3505 and 3788 kHz. QSL via UV3GM.

_A_r_g_e_n_t_i_n_a_.

The station signing L8D/X is really LU8DQ operating portable in southern Argentina. Jorge gives his QTH as Staten Island which he hopes will count for a new country, but it does not appear to meet any DXCC criteria. It's good for prefix hunters, anyway.

_Q_a_t_a_r_.

A71BJ is a newcomer in Qatar. He can usually be found on 28 MHz ssb around 1300Z. Lef plans cw operation in early 1983.

QSLs go to G4HNP.

_C_o_n_g_o_.

Joerg, TN8AJ, is back for an extended operation through December 20. He will be on all bands, 80 through 10 meters, ssb and cw.

_S_o_u_t_h__O_r_k_n_e_y_.

VP8AOE can be found Wednesdays at 0300Z at the low end of 14 MHz ssb, sometimes with QSL manager K00JW.

_Y_a_s_m_e_.

Lloyd and Iris Colvin are leaving December 2 for Abu Ail for a two day operation. The callsign should be G5ACI/AA. Their next stops will include A4 and A7.

_S_t_.__K_i_t_t_s_.

KC00FW will be on from December 7 to 13, including the 10 meter contest. All bands 160 through 10 meters, ssb and cw, will be used.

_K_1_X_A_/_6_Y_5_.

All QSLs for contacts during the CQ WW CW Contest should go to Rick Casey, AB1U, 85 Hacienda Circle, Plantsville, Ct. 06479.

I agree that ONE of amateur radio's basic purposes is public service. The government would like to believe that is the only purpose. But as all of us licensed know, that is not OUR primary purpose for operating with an amateur license.

C'mon, guys, truth is getting bent here a little bit. I was in Japan on Xerox business in October of 1981, and I worked some 2M FM. It was always busy as hell, but the operators were snappy and unfailingly polite, both when speaking in Japanese to each other and in English to me. Now, I fled CB screaming into hamdom's sanity, and to call Japanese 2M a "CB band" is hazardously close to slander. There is absolutely no comparison. We here could, in fact, learn a thing or three about pushing traffic through a repeater from those guys.

Secondly, this oft-repeated motif of CW saving the day when the dam breaks and washes the town away or when the boat's going down and sombody stepped on the mike or when the earthquake has toppled the power lines and all you can do is solder D cells to a transistor and tap wires together, I mean, Lordy, isn't that getting a little obtrusively Hollywood? Since when does public service begin and end with disaster communications? Does the world have to practically end before ham radio performs public service? I've done aa fair share of what I consider public service without sitting in the middle of a hurricane.

Also, although I don't have any of my ham books at my elbow, I think there is a little more in the Intents and Purposes section of the Rules than simply Public Service. We also have an obligation to advance the state of the art. The two go hand-in-hand.

Now, I asked this before but nobody picked it up. So let me reiterate:

WHY do CW freaks always assume that a code-free license is a mortal attack on pounding brass?

NOBODY in this argument has yet advocated a reduction of CW-only band space.

NOBODY has advocated reducing the privileges of those who earned tickets

by learning CW.

So why in heaven's name has this issue generated so much heat? The code-free license advocates are putting forth a CHOICE. The CW defenders are insisting on a rigid, single path. I smell a month-old egg.

(*Lest folk get suspicious, let me point out that I still use CW when it's appropriate. I built the ARRL's "Third-World" 20M CW station and I run it off solar cells on camping trips. I'll be as ready as anybody when a hurricane roars into Rochester NY. *)

73 and all that,

Jeff Duntemann KB2JN

For some years, I have been getting some of the consumer electronics dealers' magazines which cover stereo, video, and similar types of products (magazines like Audio-Video International, Consumer Electronics, Sight & Sound Marketing, Audio Times, etc.). None of these give any coverage to ham gear or direct any of their editorial material to dealers in the ham or commercial radio field. Can anyone point me to the existence of dealer-oriented magazines directed toward the dealer in amateur radio equipment?

On a related note, can anyone point me toward wholesale distributors of ham gear? I have had dealings with and receive catalogs from a number of distributors who will supply a small business with inventory in small quantities, such as one at a time, usually with an 800 number to call and shipping UPS COD. None of these handle ham gear; the nearest they come to it is scanners and CB radios. Does anyone know of any distributors who operate in this manner and handle amateur equipment? I am particularily looking for such a source for ICOM gear.

Thanks much,

Will Martin

I understand that there are 4 million Japenese (maybe more now) that use 2 meters. Maybe the Japenese are a little more prudent than us. We have 300,000 licesed to use 2 meter (most don't) and that's becomming a mess.

The basic problem is that people intereseted in the commuinication art should be Hams. People only interested in cummunication without leaning the art should be on CB bands, not ham bands. Remember, CBers have other frequencies besides 11 meters but never use them. These are for the people that want to talk and not lean skill.

I also disagree that a Code-Free licese will spurn forth technical development. All atempts in this respect have failed, as I have stated.

I also would like to point out that we have never had a genuinne disaster on a national scale in the US. For example, a complete failure of power generation in the US (oil cut off), or a large meteor hits (it happens on the order of once every Hundred years that a few hundred or thousand square miles gets wiped out by one, we have been fortunate up to now), or an atomic war, or an invading Army etc.,etc.

Improbable ? Maybe.

The choice is not CW or not CW, the choice is a body of technically competent and operator competent Hams that can communicate under any conditions. CW is that competance required so that the operator can operate effectively under any foreseeable conditions.

Incidently, the reason for the proposal of the Code-Free Licese is that the Reagn Administration wishes to stimulate the faltering economy by getting a lot of guys to buy Ham rigs. Reagan originally tried to stimulate business by opening all public lands to anyone who could make a buck off of it, reduce taxes to the righ below what taxes were for them 10 years ago while giving the middle class a "tax break" and then raising Social Security so they are mostly paying more.

This produced a depression. We are still waiting for the benifits.

If the Ham bands open and we have another CB craze then Japan will benifit, not the US. In the last CB craze 95% of the equipment was manufactured in Japan. No import tax because the senate did not want to offend Japan because the farmers were selling them wheat and cotton. So we gave them our electronics industry. The purpose of the FCC introducing code-free liceses has nothing to do with improving the Ham service. So who really benifits from a code Free licese. I don't know. Does anyone ??

Joe

The Captain cried, "Another blast from those $%~#@ Xydjfs !!!! Its carried away our radar and communication system !!! But we can outmanuver them !!! Turn on the foreward thrusters and get to excape speed !! We can warn Earth of the coming Xydjfs invasion if we can get a message off in time !! Call Rick Snafu, Electronics Genius, He can do it if anyone can !!!!"

Rick Safu amples in, sits down, puts his feet up on the rocket ships control panel. "Whatdaya want cheif ?"

"Rick," yells the chief, " its up to you, Earth will be destroyed if we don't warn them. You are the only one aboard that can do it. We must communicate with Earth."

"Nothing to it, Chief. I have already looked through the ship and the only thing left is one old 2N2222. I can wire it up in a giffy, nothing too it. I leaned
the morse code as an Eagle scout so we won't have any trouble keying it by shorting these two wires togeather !!!"

"A Genius !!! Rick, you have done it again. The Earth will be saved from the dreaded Xydjfs !!! and we owe it all to you !!!"

"Remember that on my next review. Well, here goes."

SOS SOS SOS de Space Ship Beagle
SOS SOS SOS de Space Ship Beagle

"Blazes," cursed the captain, "Why don't they respond ? Your signal must be getting through. I can hear them all yacking away on 2 millimeters."

"Aw nuts, " said Rick, "don't you remember ?"No Hams copy code anymore, particularly on the downlink frequencies. They all have code free liceses now !! The four to eight hours needed to learn it was just too much for their poor little brains."

"Then Earth is doomed," said the Captain.

"Yes, " said Rick, "The future is theirs that prepare for it. The settlements on Sirus B require code for all licenses. Lets head there and warn them on the way. No point in going back to Earth. Shows you what happens when you depend too much on technology you cannot really control. When something goes wrong you have to drop to a lower technology.

"Well," mused the Captain, "Thats the law of life, survival of the fittist, not the
most sophiticated."

Joe, N2XS (spark forever !!)

Thank you for your message Joe. One of the best parts about it is that you replied by mail rather than a net posting. The subject is getting rather tedious and it's good that we keep the crud down as much as possible.

However, I catagorically disagree with the statememt that Ham radio

exists solely for the public service and has little other justification. In fact, in the first part of the Communications Act of 1933, which is the canonical piece of legislation for Ham radio, it states that the purpose for the Amateur Radio Service is to promote the state of the radio art and provide a public service in times of need. If CW requirements merely impede the promotion of the state of the art by keeping out those people that would otherwise provide a valuable(?) contribution, then the CW requirements are meaningless and should be removed. Then these people would truely be engaged in promoting the state of the art and would therefore in the truest and most conservative definition of the term, be Amateur radio operators - Hams.

Also, it has been my experience that in this day and age, very little true public service is provided by an Amateur's actually knowing the code. There are alot of CW traffic nets running around on the HF bands which have become "grandfaloons" (A Kurt Vonnegut term meaning a proud but meaningless organization of individuals such as the Veterans of Future Wars, or the Portland Radio Club). Some bands have become grandfaloons altogether and provide little to the promotion of the radio art or the public service regardless of the activity on them. Most Amateur public service comes from a bunch of radio nurds running around with 2 metre HTs in their hands or mobiles in their cars. Occasionally, in the case of a large disaster, this is augmented by one or two base stations relaying DX traffic around the country on the HF bands, some of which is done - quite efficiently - in the CW mode. But the actual amount of public service provided by the CW mode, when compared to the public service provided by other means, is only a few percent.

I, therefore contend, that if we intend to keep our frequencies, we better start letting in those people with the real talents neccessary to make Ham radio a true and meaningful public service, before the FCC starts to catch on as to how much Ham radio is becoming an anachonistic grandfaloon.

Again, I thank you so very much for your response.

  If you are deaf but can read Morse code at 20wpm by taking the output from a shortwave receiver and plotting it on a strip chart recorder, are you eligible to obtain an amatuer radio license? Or is it illegal for deaf people to get a license? If anyone knows the answer, I would appreciate finding out.

The code requirment is fine & dandy for you people out there that have already suffered, but as an EE I'm interested in the technical challenge of HAM, and am not really interested in being forced to learn code.
     If I can teach a uP to send/receive morse code isn't that enough ??? Granted, it would not be easy to have people do techincal projects instead of code, but learning code ...

By the way, I am trying to learn code !!!!
I bought a Heathkit Novice course, and have already learned most of
the technical/liscensing (bullxxxt), the code ...
...so far I've learned 'E' & 'T', but 'A' & 'N' confuse me ...

...all this just to get on a packet switching network ...

To Joe, N2XS ("spark forever"):

I am not going to answer all of your arguments, since I already
addressed most of them in my previous message, and that Jeff
Duntemann adequately addresses the Japanese code-free license.

However, I do have a reply to an assertion you made:

"All Navy opoerators are still trained in CW and there will be no
change in the future despite satellites and backscatter."

This is untrue. The wife of a good friend of mine was a radio operator
in the Navy until several years ago. Here is the reply I got from
I asked about the Navy requirements:

"You were right about the Navy radio operators. Only the submarine
operators go to code school, Judy says -- it's a special school distinct
from the ordinary radio operator's school. Whoever told you otherwise was
probably in the Navy many years ago; they might have done it that way then."

Again, I am not denying the usefulness of CW in many situations; I am
only pointing out the opportunity costs involved in making it a forced
requirement for an amateur ticket.

Subject: codeless licences
X-Google-Info: Converted from the original B-News header
Posted: Thu Dec 9 20:38:13 1982
Received: Thu Dec 9 20:38:13 1982

It is very interesting listening to the opponents of the codeless
licences flame. Particularly since two of the major arguments seem
to be:

    1. A non-trivial code requirement helps keep out the turkeys
    like the ones on CB...

    2. It's not that hard to learn the code, why bother with the
    codeless licences...

Has nobody but me noticed that these statements cannot both be true?
I must admit that I think #2 is much more accurate, to judge by some
of the people who *do* get licences. My own view is that the code is
a psychological barrier to valuable people and fails to dependably
exclude turkeys. The idea of tossing out the code while toughening
up the technical side of the requirements strikes me as a fine idea,
and I think the second half of that idea is much the more important
one. Now *there* is a reasonable way to get rid of the turkeys.

The people who argue about the importance of code for emergency
communications are missing the point. If I am not interested in the
code, and learn it only for the exam, how likely is it that I will
stay in practice? And if I don't stay in practice, what are the odds
that I would be able to copy code effectively in emergency conditions?
Maybe ten or twenty years after the licence exam? The people who can
use code effectively are the ones who stay in practice, and would most
probably do so whether it was required for the licence or not. The way
to get effective emergency communications is to put all the smarts
(like error correction and conversion from signals to readable symbols)
into the hardware, and then make that hardware useful and *cheap* so there
will be lots of it around. We'd be better off with a bit less code and a
bit more technical progress, not the other way 'round.

ARRL 10 METER CONTEST

When: 0000Z Saturday, Dec. 11 until 2400Z Sunday, Dec. 12.

Where: 28 MHz, phone and cw (below 28.5 MHz)

Exchange: Signal report and state or province. DX stations transmit
signal report and serial number, starting with 001. Maritime
or aeronautical mobile stations send signal report and ITU
region (1,2, or 3). Novice and Technician stations sign /N
or /T. Novice and technician licensees count twice as much
for scoring as other stations.

Received: Fri Dec 10 05:19:02 1982

While much has already been said on the net about code-free licenses, it seems to me there have been some spurious arguments made against the code-free license proposal that have not been adequately challenged. (For what it's worth, I've been ham since age 11, an Extra for the past 20 years, love CW, and would fight hard against any proposal I thought might lead to the deterioration of ham radio.)

1. There have been a lot of hams arguing for retaining the code requirement by pointing out that anything worth having is worth working for, that those willing to make the effort to learn the code will make better hams, etc. There is a basic point being

missed here: the reason a code-free license is being suggested is not so that prospective hams won't have to work so hard, but because of the feeling that the code requirement is arbitrary and unncecessary in today's world (I'm not sure I agree that it is unnecessary, but that is the CLAIM). What the the no-coders are (or should be) saying is let potential hams put themselves out in learning something USEFUL, like modern, relevant, theory. An analogy: suppose, because of the slowness with which regulations change, it was still required that hams know how to construct and adjust spark transmitters. One could use the same argument we keep hearing: "it only takes a few weeks to learn enough about spark transmitters to pass the test; we all suffered through it; new hams should be willing to make the same effort." Obviously the real question is whether knowledge of Morse code is one of the more relevant skills to communications in the 1980's, not whether new hams should be made to "suffer" in exactly the same way we did.

2. The argument is often made that without a code requirement, the ham bands will degenerate into the idiocy heard on CB. There is an interesting phenomenon that has to be taken into account, however. The region between the top of the citizens' band (27.4 MHz) and the bottom of 10 meters is inhabited by the so-called HFer's. These people are unlicensed but bought ham rigs that are operable on SSB below 28.0 MHz. The interesting thing is that in this frequency range you hear none of the sub-human screaming so typical of CB. In fact it is indistinguishable from a ham band, except for the call letters. While I certainly don't condone people squatting on a chunk of spectrum assigned to other services, the "HF" band demonstrates that there is reason to hope that, where the proper example is set, no-code doesn't imply CB.

3. The only arguments I find somewhat persuasive for retaining the code requirement for all licenses are that a CW transmitter is trivial to build from junkbox parts (and therefore instantly constructable after a major disaster) and that CW is an outstanding weak signal mode and it is in the public interest to have a corps of operators who are proficient in it. The flaw in this argument is that even at present, with code mandatory, a large percentage of hams are "functionally illiterate" when it comes to CW. (And I'm not referring only to Technicians.) Of how much use in an emergency is someone who cannot even recognize his own call at 5 wpm? (Furthermore, a large percentage of currently-licensed hams could not even construct a keyed crystal oscillator without step-by-step instructions and a parts kit.) The point is: at present there are two types of ham, those who like CW and know how to use it, and those who somehow got their license but essentially no longer have any useful skill in Morse code; if a code-free license is offered, precisely the same situation will exist - those who are interested in CW will get the HF licenses and maintain their skill, while the same large percentage of hams will be functionally code-less. If the no-code-free-license people carried their argument about CW and

public service to its logical conclusion, they would have to insist that all hams demonstrate, every couple of years, the ability to use CW at a reasonable speed. Anything less is little different from having a code-free VHF license.

This is a C version of the MUF predicting program appearing in DEC 82 QST. It should run on v7 or usg or compatible systems. Testing so far has consisted of comparing output with the example in the article. with a -f flag, minimuf accepts 1 or more 10mHz readings from WWV which are smoothed and converted to sunspot number according to the graph in the article. Enjoy.

Ishkra 3, the Russian amateur radio satellite launched last month from
Salyut 7, has been heard with its transponder on. Frequencies:

uplink: 21.230-21.270 mhz
downlink: 29.580 - 29.620 mhz
beacon: 29.583 mhz

The telemetry identifies as RK03 in cw. If the "R" channel value is
other than 00, then the transponder is on.

Alright, I can see how this discussion has moved to a new (lower?)
dimension. Two can play this game.

Setting ASRM [asynchronous sarcastic response mode]...

Scene: Aboard the Starship CodeTrek, in the year 2116, patrolling the
outer reaches of the solar system. In an attack by the evil Vogons
on the CodeTrek, the chief communications officer has been killed.

Helmsman: Captain! The entire Vogon battle fleet is just passing the orbit
of Pluto. At their velocity, they will reach Earth in only 5 hours.

Navigator: I have their orbital data plotted, sir.

Captain: We must get this 5 megabytes of data to Earth to warn them in time.
Get that ham operator up here to run radio communications, and get this
information off to earth.

Hot shot CW operator (N2XS's great-great-great grandson): OK, captain, I
can do this with just my 2N2222 and 9-volt battery. However, at 25
words/minute, it will take 555.555 hours to get all the data across.

Captain: 555.555 hours!?! Why don't you use ASCII?

Operator: Ass-key? I use only my hand on the key, thank you.

Captain: No, NO! ASCII is a computer code!

Operator: Oh, those newfangled machines. *I* don't need them. Why, I can copy CW blindfolded in my sleep. Did I ever tell you about the time...

Captain (exasperated): Can't you start sending the data now?

Operator: Oh, sure, cap'n, but I don't think it'll do any good. There are only two ham radio operators left on the earth these days, one in Antarctica and the other on a DX-pedition in Nepal. Since they never removed the code requirement, we were able to keep all the kids, lids and space cadets off the air and keep the airwaves open for us REAL operators. Of course, there aren't too many of us left these days...

Captain: Can't you run the packet-switched hyperspace net?

Operator: What's that? Captain, I can even send at 30 wpm if I tune up my Vibroplex. I don't need any of that digital stuff. Look, it almost ruined ham radio when it came out 150 years ago. Its still too new to be relied on for the safety of the Solar System, I say.

Five hours later, the Vogons build their hyperspace bypass through where the planet Earth used to be.

Mr. Paul Rinaldo, W4RI
Editor,
_Q_E_X: The ARRL
Experimenters' Exchange
1524 Springvale Avenue
McLean, V.A. 22101

Dear Paul:

In the spring of this year at the packet radio meeting held in Murray Hill, you and I discussed some of the regulatory problems facing the development of a high frequency data network. One key problem was the legality of running a H.F. packet station in unattended mode, where unattended implies operation of a radio without a control operator present

during transmissions. Without releasing amateurs from the requirement that all H.F. transmissions must be supervised by an operator, automated H.F. networks are impossible to achieve.

On July 7, 1982, I made a request of the F.C.C. to allow operation of my station, using the error correcting teleprinter code know as AMTOR, without a control operator being present. I was delighted on November 19, 1982, with a positive response from the F.C.C. Although not everything I requested was allowed, I was pleased to find that I got more than I thought I would. I can now run unattended on H.F. with AMTOR.

I encourage everyone involved with the establishment of automated data networks using H.F. to seek waivers of the rules, as required, to permit the rapid and continual growth of this technology. Amateur Radio is progressing!

73,

Sigh. Yet another ad-hoc protocol invented "because none of the other protocols were good enough".

I did this once myself (with PCNet) and came out of it with the belief that in most cases, it doesn't really matter what the protocol is. It only matters that there IS a protocol, that is, an agreement among all the potential users. The larger the group, the better, since the objective is easy interchange.

Now that the major packet groups in SF, Tucson, St. Louis, New Jersey, Washington, Vancouver, and elsewhere seem to finally be agreeing on the need for protocol standardization (probably due the the prospect of a satellite mailbox system within a small number of years), out comes yet another protocol.

Look: somehow with the horrendous UUCP protocol we've managed to patch together a network of hundreds of computers and thousands of people. Surely with that as a daily example you can live with the problems (and yes, there are plenty) with the agreed-upon standard link-level amateur packet protocol (which itself follows several ISO/ANSI standards, making it likely that cheap available hardware, software, and gatewaying will be available).

Please reconsider? Yes, it's definitely fun to play around designing and implementing a protocol for a year or two, but if at the end of it you can only talk to 4 other people, why not consider doing something with better odds?

     John Gilmore, Sun Microsystems

PS: Yes, PCNet works, sort of, and yes, I can talk to about 4 people with it. And yes, it took a year.
PPS: There are cheap ways to calculate CRC in software, like ~10 instructions per byte as I recall. It helps a lot to know the math, which I don't.

I must admit that N2XS has one of the more unique arguments against relaxing the code requirement, however, I suggest a more likely scenario might be this one:

.....

Rick Snafu thought to himself "Cranfols! Why do I always get the Planet MC-4-EVER assignment? Why, it was only a few sectons ago that they learned how to use Electromagnetic waves as a communications medium. The last time they were still using the simple amplitude keying method common to most developing civilizations in their early attempts at communications."

"Well, I may as well make the best of it, perhaps they have at least discovered the tefsom" thought Rick as his ship assumed a standard scanning orbit above the Planet. He decided to let the ship computer run the scanning mission, so that he could grow some additional memory for his home computer system.

Sometime later, he Computer signaled that it had completed its scan of the the Planet, and that it had condensed the information into a format compatible with the brain interface. Rick signaled the Computer to begin the transfer. "Impressive", he thought,"they have advanced themselves well in 3.579 sectons. Stop - what is this? (remembering his earlier mission) They are STILL using the amplitude keying method? Surely they have developed their understanding of communications theory to point where they realize that amplitude keying is a less efficient form of modulation."

"Silly MC-4-EVER'ers", he thought to the ships computer, "They advance their technology as quickly as most, yet their society lags behind the state of the art by many wenips. Their system of government is partly to blame, however, the main problem is that much of the population embraces the old ways of life. This group called radio amateurs is representative of the problem. In spite of efforts on the part of their government, they still refuse to begin phasing out the amplitude keying method. They foolishly believe that in times of disaster they could fabricate communications equipment with raging storms or exploding bombs all around them. Worse, they believe that CW equipment is somehow more reliable, because of its primitive modulation technique, yet most of their new CW equipment uses the very SAME complex technology they claim is unreliable."

"Take us home, Computer, Planet MC-4-EVER's society is still too backward to justify contact with our own. Before we go, let us hint at our existence, in case there are some forward thinking individuals on the planet. Send a packet describing the position of our planet. Use their AX.25 coding." The computer sent the packet, then warped the ship out of orbit. Below, on Earth, "full break-in

keying CW" operator paused for a second, mistaking the packet for
the other chap trying to break between characters. "Blasted atmospherics",
he grunted, and continued his transmission with "_... ._ _..   __._ ._. _.
.___ ___ .   __ ___ ._. ... .   _._. ___ _.. .   .._. ___ ._. . ..._ . ._."

.....

Subject: AX.25 & Oregon Packet Radio
X-Google-Info: Converted from the original B-News header
Posted: Sat Dec 11 15:39:29 1982
Received: Sun Dec 12 10:25:12 1982

Regarding the proposed packet radio standard for Oregon:

The Amsat/Amrad AX.25 standard, since it uses HDLC at the link layer,
allows the use of the HDLC link controller chips such as the Intel 8273
and WD 1933. Those chips do bit stuffing for 8-bit transparency,
CRC-16 calculation and checking, and 8-bit address recognition.
Since these chips do so much of the work, we didn't feel it worthwhile
to sacrifice using them just so we could have error correcting codes;
over short propagation delays, its just easier to retransmit a bad packet
than to try to reconstruct it from the error codes.

AX.25 allows for specified routing of a packet, by having a series of
fixed-length callsign fields. The last callsign in the string has the
lsb set (this is compatible with X.25 address extension). Routing from
one station to another is up to the choice of the relaying station;
it could indeed fire off duplicate copies over two links if desired if
the links were considered unreliable.

Now that we have a protocol with has been agreed to by a larger
percentage of the amateur packet radio community than ever before,
the area which has the greatest potential for improvement and
standardization is modulation techniques. Clearly, using Bell 202 (FSK)
modems on FM channels is inefficient. In fact, the link margins
available on the dedicated Phase 3B packet channel won't support it
at any reasonable bit rate.

We are looking at two promising methods, minimum shift keying (MSK)

and binary DPSK. The latter will be used for the Phase 3B engineering telemetry channel. I'd like to get in contact with anyone experimenting with such modulation techniques to share experiences.

This is a proposal for a small network protocol suitable for ham radio use. There is a small group of us here in northwest Oregon working on setting up a simplex VHF network around this specification. Any constructive criticism or comments will be accepted. (by mail..)
Dave Schmidt WB7RDI

PROPOSED PACKET FORMAT
(Preliminary information)
constructive comments or suggestions welcome

David Schmidt WB7RDI

ABSTRACT

Packet radio (and networking in general) has numerous uses, especially in the areas of personal

computer file transfer, electronic mail, and general communications and control. Most of the common protocols are not suited to Amateur Radio, and have limited applicability in a highly volatile network. This packet format is intended to implement ISO level 1 protocol, providing regional networking with compatibility between many, possibily incompatible, local networks.

Format Description (format info: see appendix B)

%03x	packet length
%01c	packet data type: B=binary, T=text, C=control
%03x	sequence number this packet
%03x	last sequence number acknowledged from next dest node
%s	variable length to/from list
%s	variable length data
%04x	packet check word (see appendix C)

1. All values are 7 bit ascii, except in the data area, which are by default 7 bit arbitrary binary.

2. Most significant bit of each 8-bit byte is an odd orchard bit. (see appendix A)

TO/FROM list format:

The to list is just the sequential list of nodes the message is to follow in it's journey. The node names are separated by '!' characters,* uucp style. Spaces and control characters are not allowed, since they tend to make handling I/O on some machines a problem. Node names ought to be kept to 10 characterss or less but no formal limit is needed. The list also contains a from section to allow the receiving node reply to the message. This list is built up as the packet travels, with each station pulling its node name from the to list and putting it, along with its delimiting character, onto the beginning of the from list. The to and from lists are separated by a '<' character. A period delimits the last entry of the from list.

EXAMPLE:

To send a msg from 'abc' to 'def' by way of 'efg' and 'ghi':

ghi!efg!def<abc.

This string is interpreted by node 'ghi' and changed to:

efg!def<ghi!abc.

and by efg to:

def<efg!ghi!abc.

and def could respond to the message with:

efg!ghi!abc<def.

NOTES:

1. No node name may contain '<' characters!

2. The to/from list length stays constant. (feature)

---

* The delimiter character tells the node how to relay or accept the message. Initially, the only delimiter character will be the exclaimation point, but other delimiters could be used. (see 'Future Features' section)

Data Type Compression:

Text type (type = 'T')

No compression, since ASCII is a 7 bit code

Control type (type = 'C')

No compression, use ASCII upper case. This is same as text type except the data goes to the protocol handling software instead of the operator. It could be used to get an acknowledge on the last packet of a message, or to enquire about the status of a node, as an example.

Binary type (type = 'B')

To allow shipping 8 bit data, encode 7 bytes of input data into 8 7-bit values, justified in the lower 7 bits of the value. The first 2 bytes of the data are the logical record length in bytes, and the logical records are zero filled.

EXAMPLE:

To send the ten bytes 1,2,3,4,5,6,7,8,FF,99 the records are:

```
logical   000A0102030405060708FF99
physical  00024010100C0805
          0301310F7C640000
```

The physical record is treated as a bit stream that is then split into 7 bit groups that are moved into the least significant 7 bits of 8 bit bytes in the data portion of the packet. This way, the orchard bit is still available for error correction.

Future Features
(not in preliminary release, but to be introduced)

The following features may become more desirable as network traffic increases to more congested levels.

Fork:

This feature will allow one packet to travel (possibly through several relay stations) and split at some point into packets that continue along divergent paths. The reason

for this is to allow a station to send a packet across the network to another area and distribute it locally. In the initial implementation, it is necessary to send individual packets to each destination station.

Keep copy:

This feature allows a station to be a destination as well as a relay node. It may be easier to include this with the fork function, but for now it is proposed as a separate feature.

Gateway:

This will become important with time, as more networks become available. A gateway is simply a node that is 'bilingual'-- it can understand and generate packets in two or more different protocols. A gateway will have to look at the rest of the to list and decide what network it is for. This implies that the to/from list should have the ability to have arbitrary strings contained in it. For example, if it was desired to send a message to the gateway 'xxx' into a foreign network, it might be necessary to encode the foreign network destination address in the to/from list as follows:

```
abc!xxx!$somestring$<here
```

The 'somestring' portion would mean something to the gateway, but not necessarily to other stations on the network. This implies that the initial release of the software should be tolerant of any substrings prior to the '<' character unless it is to the left of the first '!'. This is not a serious problem, and

would require little work now, while possibly saving lots of work later. Note that this

precludes the use of '<' in the foreign network address string.

Syntax for future features

FORK: (tolist{,tolist})

To send a packet to a, b, and c(via d) from e via f:

f!(a,b,d!c)<e

KEEP: use delimiter & instead of !

To send a packet to a, b and c (in that order) from d:

a&b&c<d

GATEWAY: no special syntax

To send a packet to someone on usenet from the ham network:

gateway!usenet address string<wherever

The gateway must be able to identify which network the message is for by some means (possibly the next node name) and process the rest of the to list accordingly.

Implementation Hints

The protocol defined here does not define the type of transmission (I.E. synchronous or asynchronous), the timing of bits or transmitter keying, any upper level layers of the protocol (except where it is necessary for upper levels to pass data to this layer, as in passing the address list to this layer), hardware implementation, etc. This document is a suggestion for a data format which will allow the transfer of data between local area networks (LANs) with utilize different formats. The other use for this document is as a place to start.

Recently AMSAT came out with a specification for a network protocol which is optimized for satellite transmission. I feel their protocol is unsuitable for use as an emergency network, or for any unstable one (as ham networks seem to be *). The AMSAT network is really just the bottom layer (layer 0) of an implementation which is best suitable for situations where a full duplex repeater is present. It is entirely possible for the format described in this document to be implemented in a half duplex environment (which is what I intend to do) utilizing much of the HDLC format which AMSAT has proposed in their bottom

layer specification. I am not rejecting AMSAT's proposal, but suggesting that it doesn't handle the problems of LANs.

The system I am implementing consists of a datagram service, with either automatic or manual routing (done at a higher level) done at the point of origin. This allows relay stations to pass on the datagram with little processing, while still allowing features typically found on large networks.

---

* By unstable I mean that the existence (as far as other nodes of the network is concerned) of a node (station) is dependent on factors such as the antenna falling down, kids unplugging the rig, etc.

This is a description of the particular layer 0 software and protocol to be implemented for my use (and by some of the hams I work with). It is included here as an example, not as part of the level 1 protocol referred to in the rest of this document.

The software used in the network will be written primarily in machine independent, high level code (C language), with the machine dependent sections clearly separated from the rest. In this system, the bottom level will get a buffer of transmit data (with the header already

in place) and will place it in an SDLC format frame. The SDLC address field will be set to the 'global' address (address 255) for any transmission that is to be directed to a node that has an unknown address, such as when a relay is desired, but otherwise is undefined. The control field is left zeros for now, but later could carry additional information.** The information fields of the frame are filled with the data from the layer 1 buffer, and the final checksum is as per SDLC specification. This has been done to allow the Z80-SIO to perform much of the work. (Many other synchronous interface chips have the ability to do this, such as the Intel 8251, but the Z80-SIO contains hardware CRCC generation and the Z80 interrupt structure for our Z80 based systems)

At this time, the transmit routine will wait for a clear channel, then transmit the frame, preceded by a number of SDLC flag characters (number to be defined later, after some experimentation). As soon as the frame has been completely sent, a number of flag characters are sent followed by the deactivation of the transmitter. At this point, a timer will start. If the times times out before an acknowledgement is received, the frame will be queued to be sent again. Only after the frame has been sent a number of times will the attempt be aborted. If the transmit routine detects a carrier on the channel when either the transmitter is first

---

** The address and control fields being stated this way force compatibility between SDLC and HDLC, so to the user, it is not important which is being used. NO ATTEMPT HAS BEEN MADE TO USE THE FULL SDLC/HDLC SPECIFICATION, just the basic frame format.

turned off, or when the frame is ready for transmission, the transmitter will delay for a time that is proportional to the frame length

times a locally generated random number plus some constant. This allows small frames a better chance of making it through the collisions than big frames. This is also a type of priority, making small packets more desirable to use than large packets. Small packets should serve to increase the rate of data flow, resulting in higher transfer efficiency for a particular message. It is assumed that ethics will keep people from always using a non-random number, which can result in two stations always trying to transmit at exactly the same time. This also indicates a need for a good random number generator (either hardware or software) at each station, with the number scrambled by something other than the network information, to which all stations have access.

The receive routine is always ready to receive data, depositing the data in a large buffer for processing when time allows. In the later versions, I intend to use a multi-tasking kernel in the networking software to allow the transmit routine to 'roll out' when it is waiting. This will make more time available for the receive routine to process incoming data. If the receive buffer overflows, the data that is the oldest is discarded, as a retransmission should occur to replace it.

We have been working with Manchester*** encoding modems using direct FSK of the VHF gear. This results in good signal to noise ratios for a given power due to the low bandwidth involved. It also makes it easier to 'roll your own' modem, since the FM gear has most of the 'modem' functions like limiters, discriminators, and carrier detection built in. (I have done most of the work on Icom 22-S transceivers, but work is taking place on a Motorola MICOR at this time.)

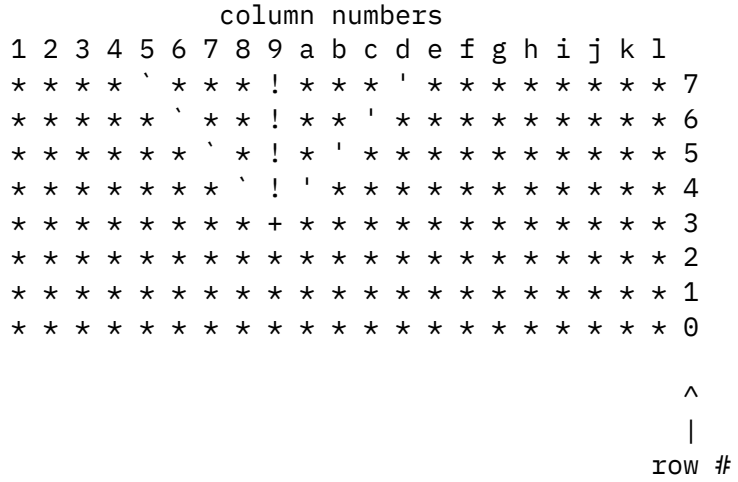
*** Manchester encoding is a method which allows data to be modulated on a carrier to achieve a 50% duty cycle over any bit period. It is simply 180 degree phase modulation of a square wave equal in frequency to the bit rate, and synchronized to the bit rate (don't worry, it fits into about 4-6 ICs). This allows the data to pass through AC coupled stages without as much distortion as would usually happen.

APPENDIX A: Orchard codes

Orchard Coding -- a method to correct and detect errors

The orchard code was covered very well in Electronics, May 5, 1981. A brief description is in order here, though.

Imagine an orchard (with each tree being in either a row or column) with a road running along one of the rows at the edge of the orchard. To identify any given tree, several methods could be used: the row and column of the tree, or some other geometrical relation. If the only way to identify the tree is by placing flags along the road, it becomes apparent that the tree in question can be identified by placing flags by the columns in which the tree is a member. Some agreement about the definition of columns is needed, of course. This is the theory used here; any bit can be singled out of an array of bits by flags at the column it is in, as well as by the other columns where it is visible at a 45 degree angle. (see below)



To point to the bit marked with a plus sign (col 9, row 3), it is only needed to mark columns 5, 9, and d. These are on the diagonals marked with quotes. By calculating a 'parity' * for each set of diagonals from a bit, it is easy to compare this parity later to see if anything has changed. It is also fairly easy to see that if columns 5, 9, and d are of the wrong parity, the bit marked with a plus is in error. I have found that it is possible to reconstruct data that has been badly damaged fairly well, but it is possible to reconstruct it wrong if there is more than one bit in error in a local area (the diagonals for two bits near each other intersect at several locations) which is why a second check for data integrity is used (see the checksum words at the end of the packet spec). Orchard codes on 7 bit data (8 bit bytes) cost 12.5% overhead for binary data, and are free for ASCII, as compared to 50% and higher for many error correcting codes. They also seem to be good in the bursty noise environment in which radio seems doomed to live. (Much like holograms, a lot of the buffer of data can be reconstructed from what is left, but also like holograms, the 'image' detail deteriorates as more of the buffer is destroyed.)

In the case of light channel usage and short frames, it is probably just as well to retransmit the frame, but when usage is high or you have an

error in a large frame, reconstruction can save valuable time.

---

* It is rather arbitrary, but I have treated the parity calculation much the same as it is done in the usual usage of parity: odd parity = odd number of bits in a group, even parity = even number of bits in a group, including the parity bit in a group. When I say 'odd orchard', I mean 'there are an odd number of bits in each group of diagonals from an orchard bit'.

APPENDIX B: Format specification

The format for the data is specified to be compatible with standard 'C' printf format strings. For the benefit of people not familiar with printf, the following information is supplied.

- The percent sign is used to signal the start of a format specification. In the usage shown, it is not really necessary.

- The number following the percent sign (when present) specifies the number of

characters of information that should be output. Furthermore, if the number starts with a zero, the leading zeros should be printed.

- The character following the number specifies the type of data: 'c' = a single character, 'x' = a hexadecimal value, 'd' = a decimal value, 's' indicates a string of characters (the string does not contain anything except the characters, no termination characters or leading and trailing blanks are intended). The only variation from standard C definition is in the case for hexadecimal characters: capital letters are more portable.

  EXAMPLE:

  The string %03x%2c%s

  indicates a three character hex number with leading zeros followed by two characters, followed by an arbitrary length string.

APPENDIX C: Some thoughts on the checksum field

The checksum field would ideally be something along the lines of a CRCC-16 check

word, but software implementations of CRCC-16 take several seconds to execute for packet lengths over a few bytes (4095 bytes took approximately 7 seconds when written in BDS C -- but I don't maintain that I did the most optimum coding). For the moment, I plan to use a simple summation of the bytes of the packet, which takes much less time to calculate.

I would appreciate comments on this subject, as well as on the possibility of assuming the existence of hardware CRCC in the system doing the error correction. It would be possible to allow the checksum field to be unspecified, and just let error correction happen between stations that agree on a checksum method, since the packet checksum could be verified in a lower level by something like the HDLC frame check sequence. In this case, the checksum specified on this level would be used only for the error correction system. The type and existence of the packet checksum word could be defined for any given LAN, with the gateway stations handling conversion from one checksum word format to another. Within a LAN, the case of the data type character could determine whether error correction was 'turned on' for a packet--upper case indicating orchard bits and checksums present and lower case indicating that no error checking exists in this level, for example.

SUBJECT: re: deaf hams

yes, there are several deaf hams.
Other methods of making output available are with signal lights (similar to
what the navy uses in concept) and a pad over a speaker where the deaf ham
can feel the vibrations of the morse code.
I have heard of several deaf hams using the "touch the speaker cone" technique

qst de ad7i
hr dx bulletin nr 49 from arrl headquarters
newington ct december 9, 1982
to all radio amateurs bt

thanks to k1mem, k1mm, w1trc and n1ajo of the southern new england dx association for the following dx information.

china. by8aa has been very active at 0100z on 21050 khz. he has a real raw buzz which makes his zero beat reat hard to locate.

lebanon. od5lx will be on 28744 at 1130z saturday and sunday for cw qsos. qsl via sm0dgz.

svalbard. jw5vaa and jw5ig have also been found on 28744 around 1200z.

falkland islands. vp8apk, vp8li and others from the falklands as well as vp8aoe from south orkney have been very often on the low end of 20 meter ssb in the evenings.

tunisia. 3v8aa shows in the company of 9y4rd/su at 1400 to 1500z on 28744 for cw and ssb qsos.

trindade islands. look for the rumored py0 operation from trindade december 10 to 14.

iraq. europeans can look for yi1bgd on 21155 at 1000z and for north america check 28505 between 1200 and 1300z.

160 meter band.
zs4pb has been on 1841 ssb at 0300 to 0330z.
hz1ab continues wednesday and thursday evenings at 0230z.
nepal. 4 operators including a yl will be on from 9n1 between december 15 and january 1, all bands, cw and ssb. qsl via w1gay.
st. kitts. vp2kbu will be active until december 13. qsl via kc0fw.
marion island. keep a watch for operation from the new crew at zs2mi due at any time.

heard island. with the receipt of the official government approval, the heard island dx association plans are now in their final stages.

the 18 member expedition will depart from hobart on january 2 for the fourteen day voyage to heard island. the expedition plans to stay for a minimum of 14 days and hopes to be on the air around january 17 or 18.   vk0sj/mm will be operted enroute to the island.

30 meters. all u.s. amateurs are eminded to avoid the 10109 to 10115 khz segment of the new band. also, contacts on the 10 mhz band will not be creditable toward arrl awards ar

Posted: Mon Dec 13 13:11:29 1982
Received: Tue Dec 14 07:15:11 1982

An open letter to Dave, WB7RDI,

Saw your draft proposal for a packet radio network on the net. Here are a few comments/criticisms/suggestions:

- you might consider using delay modulation coding instead Manchester. Delay modulation has a minimum at dc (as opposed to a null for manchester), yet with some minor waveform shaping it should pass the ac coupled radios without much distortion.

- Should you decide continue using Manchester, take a look at the Zilog 8530 SCC. It has a Manchester encoder/decoder on chip. The receiver is not quite optimal in the sense that it uses digital techniques (digital pll) to regenerate the clock, however, it should provide adequate results in your application. As you might expect, the chip provides on board baud rate generators, bit stuffing, selectable error detection polynomials, and universal microprocessor interface (cost: ~$38).

- I was somewhat puzzled by your trying to evaluate the CRC polynomials in software. Most SCC's provide CRC generation. Even if your application requires software generated error detection (cost reasons?), there are checksums which are better suited to the sort of arithmetic available on microprocessors (CRC polynomial evaluation is long division, ie a serial process). Take a look at IEEE Trans. on Communications, January, 1982 pp 247-251 for an article describing ones complement checksums. The claimed fraction of errors which pass undetected is .001538%, versus .001526%for CRC's. The ones complement technique is not as good with double bit errors, however.

- I would strongly suggest that you consider using AX.25 packet format instead of your home grown format. You might consider building a standard AX.25 network FIRST (something stable for others to use), then set up a gateway to your experimental network.

- Some other papers in Transactions on Communications which I found useful are:

- L Ehrman, PF Maloney, "A Multimode Modem for Digital Radio", IEEE Trans. on Comm., Vol COM-27, pp 1786-1793, Dec 1979.

  This paper addresses upgrading Military FM Radios to digital service. The radios are similar in characteristics to existing Amateur FM equipment. They investigate various modulation schemes including MSK, Manchester, and Delay Modulation.

- JS Ma, "On the Impact of HDLC Zero Insertion and Deletion Link Utilization and Reliability", IEEE Trans. on Comm., VOL COM-30, pp 375-381, Feb 1982.

  This paper discusses the impact of bit stuffing on Link error performance.

o Take a look at MSK! The references are too numerous to list here, just take a look a T Comm over the last few years. You will still need a baseband coding scheme which inserts clocking info, however, it will buy you even more spectral efficiency.

hr propagation forecast bulletin nr 50 from arrl headquartere
newington ct december 13, 1982
to all radio amateurs bt

the solar flux rise that began at 171 on december 2 peaked at 279 on the 19th, the highest reading since february 1. for two days the flux was more than 100 points above the corresponding day in the

previous solar rotation, an unlikely event so far past the peak of this solar cycle. this activity pattern will be reversed, probably before the 19th, as the decline that began on the 11th is expected to be a steep one.

the high solar flux in recent days did not bring much improvement in dx conditions, because it was associated with numerous and intense solar flares. the increased geomagnetic activity resulting from these caused high absorption on all amateur frequencies. still the 50 mhz band was open marginally across the atlantic on at least three days.

the down side of the flux peak should bring generally good propagation but with the loss of 50 mhz dx, probably by the 17th. the earths magnetic field will be more stable through the forecast week, resulting in better conditions on all dx frequencies, a trend that will be reversed again about the 19th.

american sunspot numbers were between 119 and 181 last week, for a mean of 147. they have peaked and will be much lower before next weeks bulletin   ar

qst de ad7i
hr arrl bulletin nr 112 from arrl headquarters
newington ct december 13, 1982
to all radio amateurs bt

follows an update on the mt. greylock communications tower situation.
the antenna for the mt. greylock repeater on 31/91, k1ffk/r, has been
reinstalled on the tower. however, passage of h6749 is still
essential to guarantee that the antenna remains on the tower. h6749
has passed the massachusetts house unanimously but it must pass the
massachusetts senate. amateurs in massachusetts may wish to contact
their state senators expressing support for h6749 so that this
important communications facility is retained ar

Mr. Redden said that a 2 meter rig onboard an aircraft could interfere
with aircraft navigation radios. Could a 2 meter ground rig interfere
with nearby aircraft radios, for example, where an aircraft is following
the glideslope or localizer on an instrument approach? Which radios, if any,
would be affected?

I have been carying 2m handhelds on about 5 domestic flights and never had
problems - I always stated that 'I would not use them because
it is not legal'.

Once I got into trouble - in West Germany. There security people told me
that I would not be allowed to take it on board - I could
threaten to explode a bomb in my suitcase with it.....

Subject: Novice Class Exams
X-Google-Info: Converted from the original B-News header
Posted: Fri Oct 22 00:08:26 1982
Received: Fri Oct 22 02:44:21 1982

The FCC today proposed to revise its procedures for awarding the Novice
class, or beginner, 'ham' radio license. As it stands now, an
amateur radio operator with a General class or higher license tests
an applicant on his knowledge of the Morse code. If the applicant
passes, a certification notice is mailed to the commission and the
FCC then mails a written exam to the applicant. The written exam is
completed and mailed to the FCC for grading. The agency proposed
Thursday to streamline that process by allowing the licensed ham
radio operator to administer not only the Morse code test, but to
prepare and administer the written test using an FCC Study Guide.
If the applicant passes both tests, the licensed ham would simply
certify that to the commission and a Novice license would be
issued. The proposal is now open to public comment.

Now is a good time to pick up some of the contest
operators who are going to work the CQWW SSB contest
as they "tune up" for the big contest. As many are
good cw ops you can find them on cw, 14025, 21025,etc.
I have heard Belize (V3) and Tahiti (FO0) already,
and more are on each day. Listen for the pile-ups!

One advantage to these guys are that they handle their
own qsl's, and therefore the cost of getting one
is only a sase usually, saving those ircs and anxiety
over the foreign postal systems!!

Good luck!!

Subject: Amsat Phase 3B Status Report
X-Google-Info: Converted from the original B-News header
Posted: Tue Oct 26 21:42:51 1982
Received: Wed Oct 27 09:23:00 1982

ESA has announced that Amsat Phase-IIIB will now fly on April 2, 1983. The board of inquiry filed its report on the launch failure of Ariane L5 on Oct 15th. As was already stated, the third stage cryogenic hydrogen turbopump failed before normal shutdown, causing the failure. It is now believed that the failure may actually have been due to overtesting of the turbopump gearbox that weakened the unit before launch.

In any case, ESA is delaying the launch in order to subject the next launcher to a very close inspection before another launch. This makes us feel a little better; there is a saying that the best launch to go on is the one right after a failure - everybody is on their toes.

The Phase 3B mode "B" transponder (70 cm in, 2 m out) has been tested in a thermal vacuum chamber, and found to meet specifications. Peak power output is approximately 50 watts, and the AGC is set to maintain an average power output of about 15 watts. Transponder input power at the antenna terminals to obtain the average power output is about -105dbm. Bandwidth is almost exactly 150 khz.

The mode "L" (23 cm in, 70 cm out) transponder has been tested and found to not yet meet specs. Power output is low by about a DB, and the third-order intermodulation products are only 17 db down. With this latest launch slip, there will probably be time to improve the L transponder.

Subject: Amateur Radio Station on the Shuttle
X-Google-Info: Converted from the original B-News header
Posted: Tue Oct 26 22:04:44 1982
Received: Wed Oct 27 10:18:00 1982

It now appears POSSIBLE that STS-9, the first launch of the Spacelab, will carry an amateur radio station. Owen Garriot, W5LFL, who will be an astronaut on the mission, will be the operator.

The Westlink Amateur Radio News service has been hypeing this topic up quite heavily in the past two weeks. Before everybody gets all excited, there are several caveats that should be remembered:

1. The proposal is not yet final. Significant progress is being made, however.

2. STS missions are launched into very low altitude, low inclination orbits. This means that passes are short (try dialing the 900 DIAL-IT number during a mission and listen to how often they hand off to a new tracking station). Passes visible from temperate latitudes are even quicker and at low elevations.

3. If they carry essentially a 2m walkie-talkie as proposed, without repeater capability, stations on the ground will not be able to hear each other as they attempt to contact the shuttle. Combine this with the adrenaline factor, and Garriot will likely not hear much more than interference unless the amateurs calling him are VERY disciplined.

4. Shuttle astronauts (and astronauts in general) are VERY busy people. It is not clear how much spare time Garriot will have to spend yakking on the radio. On the other hand, since the mission will last over a week and is primarily intended to ferry up Spacelab, perhaps he'll have some time.

_S_o_m_a_l_i_.

DJ6SI/6O will be on for one week, cw only.

_S_v_a_l_b_a_r_d_.

JW5NM is active on 7005 kHz at 0300Z. QSL to LA5NM.

_J_u_a_n__F_e_r_n_a_n_d_e_z_.

WB6WOD/CE0/Z will be very active on all bands for two weeks.

_C_o_c_o_s__K_e_e_l_i_n_g__I_s_l_a_n_d_.

VK9YI has been active on 10 and 20 meters. No specific frequencies.

_D_j_i_b_o_u_t_i_.

Lloyd and Iris Colvin will be signing J20/DU through the end of the month. QSL via Yasme.

_C_y_p_r_u_s_.

DL0/HSC/5B4 will be on for two weeks, 160 through 10 meters. QSLs go to DK8ZH.

_F_r_a_n_z__J_o_s_e_f__L_a_n_d_.

UA1PGO may be found between 14200 and 14210 kHz around 1300Z. QSL via UK3SAB.

_R_o_d_r_i_g_u_e_s__I_s_l_a_n_d_.

DL9EAJ/3B9 is on 28550 kHz for about three hours daily beginning around 1100Z. QSL to DL0/LH.

_C_o_m_o_r_o_s_.

D68AM shows up in the DK2OC net at 1200Z. WB2OHD handles the QSLs.

_S_a_u_d_i__A_r_a_b_i_a_.

HZ1AB is active on 80 and 160 meters on Wednesdays and Thursdays beginning at 0200Z on 3505 and 1827 kHz.

_B_e_l_i_z_e_.

N6ADI and WA6VNR will be active as V3DX and V3CQ through November 3. They will be on cw and ssb, 160 through 10 meters. N6ADI will handle the QSLs.

_S_y_r_i_a_.

The Technical Institute of Radio will celebrate 35 years of amateur radio in Syria with 6C35A, 6C35M, 6C35N, and 6C35O operating 80 through 10 meters, ssb only, between 0300Z December 25 and 1300Z December 26 and between 0300Z December 30 and 0800Z December 31.

_C_Q__W_W__P_h_o_n_e__C_o_n_t_e_s_t_.

Some of the many prefixes expected to be active are PJ9, PJ5, ZF2, HC8, HH2, CE0/Z, CN, CT2, FO0/, OH0/, PJ7, UF6, UG6, FM0/, V3, and VP5. Many choice stations plan to include 160 meters in their operations.

_N_e_w__B_a_n_d_.

For those who haven't heard, 30 meters is now open to U.S. amateurs. Frequencies are 10.1 to 10.109 and 10.115 to 10.150 MHz. Maximum power input is 250 watts on cw and rtty only. Enjoy.

I am not sure if the flaming on other newsgroups about for sale items apply here, but I received a letter from a friend who was down in Ecuador and Galapagos for the last 9 years, who has returned to the states. He now has the problem of getting rid of 6000 IRC's.....at 40 cents each. IF you are interested in getting in on these, send me mail and I will pass on the

pertinent info.

Here is the big contest for this weekend:

ARRL CW SWEEPSTAKES CONTEST

Contest Period: 2100Z Saturday, Nov. 6 until 0300Z Saturday, Nov. 8

Exchange: A consecutive serial number, precedence ("A" if you run
          200 watts dc or less, "B" if more than 200 watts), your call
          sign, check (last two digits of the year you were first
          licensed), and your ARRL section. For example, WN8GUE answers
          W1AW's call by sending W1AW NR178 B WN8GUE 69 IN for qso number
          178, more than 200 watts, first licensed in 1969, and Indiana
          section.

GUD LUCK!!!

hr propagation foecast bulletin nr 44 from arrl headquarters
newington ct november 1, 1982
to all radio amateurs bt

october provided interesting examples of the range of solar activity nearly three years after the statistical peak of cycle 21. the solar flux averaged 159, with highs of 218 on the 2nd and 202 on the 25th. from october 7 to 19, the variation was slight, between 131 and 145. the last half of the month brought a gradual rise from 131 to 202, and a slide back to 168 at the months end.

despite several disturbed periods of one to three days duration, propagation was good more often than not, which is normal for october and november in the northern hemisphere. scattered through october were at least six good to excellent days when all amateur dx frequencies worked well over most of the world. about as many more days could be termed average. the 28 mhz band performed well much of the time. there were several openings on 50 mhz, mainly in the lower latitudes or on transequatorial circuits.

november should be quite similar. on the down side of the solar cycle, active areas of the sun tend to be short lived, and propagation variations are less likely to recur at four week intervals. as an example, solar flux highs in october were 23 days apart, not 27 or 28. based on daily observation of the sun and frequent checks on amateur band conditions, we look for generally good propagation november 1 and 2 and 6 through 9, but with the solar flux too low for appreciable east west dx on 50 mhz. the best propagation in late november should come between the 18th and 25th, with the highest muf at the end of this period.

american sunspot numbers for october 21 through 27 were between 105 and 186, for a mean of 143. they will be lower next week ar

hr arrl bulletin nr 95 from arrl headquarters
newington ct october 28, 1982
to all radio amateurs bt

at 3 p.m. edt thursday, october 28, fcc released the major portion of the 10 mhz band for use by amateurs in its jurisdiction. effective immediately, u.s. amateurs holding general, advanced and extra class licenses may use up to 250 watts input and a1 and f1 emissions in the band segments 10.100 to 10.109 and 10.115 to 10.150 mhz. these emissions include cw and rtty operation, voice modes are not permitted. the segment 10.109 to 10.115 mhz is not available at this time because of daily use by a priority government radio service. amateur stations must avoid interfering with stations in the fixed service, because the band is allocated on a primary basis to the fixed service and these stations have priority. the amateur allocation is on a secondary basis ar

_R_o_t_u_m_a__F_i_j_i_.

3D2XN and 3D2XR have been active especially on 10 and 15 meters from Rotuma Island. Although Rotuma is part of Fiji, the operators hope to qualify as a new DXCC country. Work them first, the decision will be made at a later date.

_S_o_m_a_l_i_a_.

DJ6SI/T5 has gone QRT after a very successful one week operation from Mogadishu. QSL via his home call.

_1_6_0__M_e_t_e_r_s_.

Operation on the 160 meter band was at an all time high in the contest last weekend. More than sixty countries were reported active and some stations in North America worked more than fifty.

_M_a_l_a_w_i_.

7Q7LW is still active almost daily Les frequents 28500 to 28510 kHz from 1900Z.

_C_y_p_r_u_s_/_A_s_i_a_.

Four operators are signing DL0/HSC/5B4 from Cyprus. This operation is from the Asiatic part of Zone 20. CW only is being used, on 160 through 10 meters. QSL via DF8ZH.

_C_o_m_o_r_o_s_.

D68AM is again active after a long absence. Alain likes 29 and 21 MHz ssb.

_F_r_e_n_c_h__A_n_t_a_r_c_t_i_c_a_.

All the FB8 countries in the Southern Indian Ocean will be manned by new crews starting in mid-November. Each crew will include at least one licensed radio operator. Call signs will probably be FB8WH/WI, FB8ZP, and FB8XZ. Look for activity around the end of November.

_S_t_.__H_e_l_e_n_a_.

Jerry, ZD7BW, has been reported on 28600 kHz from 2000 to 2100Z and later on 21295 kHz.

_J_u_a_n__F_e_r_n_a_n_d_e_z_.

WB6WOD/CE0/Z continues his operation from Juan Fernandez into its second week. Joe is operating ssb only, 80 through 10 meters. QSL to his home call in the U.S.A.

ad7i msg 20

Are there any traffic handlers on netnews who would be interested
in accepting traffic via UNIX mail, originated by hams, to forward
on NTS nets. This might be a good way to generate some message
credits for yourself.

I, for one, am not much of a traffic handler. Yet, I do generate
a fair amout of traffic (arranging skeds and the like). If anyone
is interested in providing such a service to those who read netnews
(or just me!) please post a message to the net (or respond via
mail).

many thanks,

Now you can finally start saving money with that expensive HF SSB
station. The FCC has granted the amateur radio clubs at Johnson Space
Center and JPL authority to rebroadcast STS-5 communications, so you
don't have to waste money calling the Dial-It number.

W6VIO will transmit on 224.04 mhz; this may not be too useful outside
of Pasadena. However, W5RRR at JSC will transmit on 28.6, 21.36, 14.28 or
14.23 mhz, depending on conditions.

(The following information just came from an AP wire story.)

hr arrl bulletin nr 99 from arrl headquarters
newington ct november 10, 1982
to all radio amateurs bt

on november 9, fcc granted a request from the jpl amateur radio club
for a 90 day temporary waiver of section 97.113 to permit club
stations w6vio and w5rrr to manually retransmit on amateur radio
frequencies the voice communications from the space shuttle columbia.
other amateurs may retransmit the transmissions from w6vio and w5rrr,
but they may not directly pick up columbia communications and
retransmit them. the retransmitted communications shall be for the
sole benefit of licensed amateur radio operators. the transmissions
are limited by fcc rules, section 97.91, to quote information
bulletins consisting solely of subject matter having direct interest
to the amateur radio service as such unquote. for this reason,
special efforts to encourage nonamateurs to listen in should be
avoided, as this could jeopardize further waivers of this nature ar

PACSAT -- A New AMSAT Satellite Project

Den Connors, KD2S and Tom Clark, W3IWI

A new type of amateur satellite was proposed by Tom Clark,W3IWI, at the packet radio working group meetings held 8-11 October, 1982 at the AMSAT laboratory in conjunction with AMSAT's annual general meeting. The working group meeting was also noteworthy in that it provided a focus for the various packet radio groups to coordinate their activities and resulted in a new unifed protcol which is described by Hank Magnuski, KA6M, in a companion document. The new satellite project has been tentatively dubbed PACSAT -- a final name is yet to be chosen, pending resolution of some potential copy-right conflicts. This satellite would build upon AMSAT's experience in low-cost spacecraft development, the current upsurge of interest in digital and computer techniques, and the technology being developed for amateur packet radio applications. The basic idea is to implement an orbiting digital packet radio repeater with store-and-forward capabilites. This satellite would allow amateur "electronic mail" service with a few hour delivery time to anywhere in the world -- a virtual "flying mailbox" for amateur radio and computer enthusiasts.

The "strawman" system proposed by Tom and discussed during the three days of meetings, would have one or more high-speed packet radio channels, and possibly other ASCII or RTTY input/output channels. An onboard computer

system would control a large amount of memory storage -- perhaps as much as one megabyte for messages. Access to the message system would be somewhat like using a more traditional computer bulletin board system (CBBS) using landline dial-up capability. Using a Phase-2 type of low-earth orbit ("LEO"), the satellite would be available several times a day for up to 15 minutes worth of message reading and writing. Although the LEO satellites are limited in their coverage, the store-and-forward capability could extend an AMSAT-OSCAR-8 type satellite to provide global coverage.

One of the major problems with such a concept is that packet radio represented new technology to most amateurs, although we see a marked rise in amateur interest in computers. In order to make a PACSAT be a viable concept, the current packet radio "experts" will have to devote considerable efforts to making reliable ground-station hardware and software available to AMSAT's user community, and they will have to embark on a concentrated educational program to explain these new concepts -- some of the attendees at the working group meeting noted that they were around when the SSB vs. AM "wars" were raging in the early 1950's.

One of the major technical problems that will have to be solved before a PACSAT (or the AMICON channel for Phase-3B) is viable involves modems. None of the standard commercial modems seem suitable for noisy channels with doppler shift. Several alternatives were discussed during the meetings. The modulation techniques mentioned included phase-shift keying (PSK) and minimum-shift keying (MSK). Discussions of data rates for up- and down-links ranged from 400 baud up to 56 kbaud; the technical constraints associated with accptable bit error rates and practical contraints of implementation cost and difficulty plus available spectrum space led to a consensus that likely rates were in the 400-2400 baud range. Although the Phase-3B tele-command group have implemented state-of-the-art 400 baud PSK modems and W4RI has been working on MSK designs, the use of either technique will require considerable work in order to develop high reliability modems usable by the amateur community. For any digital usage of amateur satellites, it is clear that modems will be more complicated that the traditional frequency-shift keyed systems currently used for RTTY.

The strawman design Tom presented involved multiple uplinks and a single downlink (e.g., one calling uplink channel and perhaps four working channels). This built upon typical amateur net experience with the satellite acting as "NCS" on a calling-and-answering frequency. After the user calls in and establishes that he has uplink traffic (or that the satellite has a message for him), he would directed to QSY to a working message channel where the spacecraft's computer would "poll" the user until both he and the spacecraft are QRU. This design is based on the use of ALOHA-type protocols where the multiple users cannot hear each other, leading to possible "collisions" on the uplink channels; this, combined with Tom's assumption that "what goes up must come down" (i.e. the total message traffic up and down are about equal), led to the multiple uplink, single downlink proposal.

Tom's proposal was that the uplink and downlink were full duplex (simult-aneous transmission and reception) involving two bands (probably 435 Mhz uplink and 145 MHz downlink). The design assumed that 0.5-1.0 Megabyte of storage was available onboard which could be treated as a "virtual disk" for

planning. All messages would be "bit-regenerated" (i.e. no "direct" channel exists between the users except through the satellite), and control of the communications would be by an active, onboard computer. Other functions to be performed by this computer would include the access mechanism to manage the "virtual disk" storage, handling of the protocols to allow multiple users to get their messages up and down during a single pass, and possibly inter-spersing of "QST" bulletins in the downlink data stream during moments of inactivity.

On Saturday, the AMSAT members attending the technical forum were allowed to hear packet radio in action on AMSAT's W3ZM (146.235/.835) repeater. W3IWI brought a microprocessor-based Terminal Node Contoller (TNC) developed by the Vancouver Area Digital Group (VADG), a "202A-type" AFSK modem, and a standard 2m FM transceiver. Some 50 miles away in Sterling Park, VA, Dave Borden (K8MMO) had his Z-80 CP/M computer hooked to a similar TNC and modem. Amidst normal talk-in activities, the two packet radio terminals were sending brief data packets through the repeater so that those attending the meeting saw a game of "ADVENTURE" being played in the squelch tails. This impressive demonstration was the first exposure for many AMSAT members of the capabilities of digital techniques in amateur radio.

As the weekend proceeded, a number of informal discussions on packet radio continued. Among the experts there grew a general agreement on the data link protocol, with the AMSAT AMICON ADDCP-HDLC definition emerging as being the best for the "LEO" PACSAT too. Arguments for and against Tom's proposal for multiple uplinks (supporting a single downlink) centered on the estimated relative traffic loading on satellite uplink and downlink. These discussions included the observations:

-- CBBS experience shows that users "browse" through stored information much more than generating new information. If the PACSAT is to be operated as a flying CBBS, then the design should be reconsidered.

-- The "QST" bulletin transmissions will be a very important PACSAT function for the users.

On Sunday, a proposal was made by Den Connors and Lyle Johnson which included a number of the above concepts. Different mechanisms for access using full-duplex uplink/downlink pairs were presented. The AMSAT AMICON (AMRAD AX.25) HDLC logical link protocol was discussed in as a PACSAT standard and a number of network-related issues, including message classifications and buffer allocation/deallocation mechanisms were raised. Lyle presented another possible system block diagram, showing different input/output channels, including command, multiple CPU's and different memories for program store, file directories, buffers and message mass storage. The tasks of the CPU were further detailed, and the different algorithms needed were identified.

During this discussion, Tom Clark outlined the possibility of a truly international implementation stategy. Tom described one scenario with the system design and user eduction/interfacing being the prime U.S. responsibility, on-board hardware constructed in South Africa, satellite integration performed in the United Kingdom and actual launch handled by the

commercial group in Texas which has recently flown a successful test mission (see A.S.R. #41, September 13, 1982). A part of the discussion involved the possibility that part of the US role might also include a new role for AMSAT in being responsible for the distribution of the hardware unique to packet radio unless commercial interest is seen soon; this could serve as a method for generating much needed revenues to support all of AMSAT's activities. To help get this activity moving, Den Connors agreed to act as interim PACSAT coordinator.

The general PACSAT concept was presented at the AMSAT general meeting, and the AMSAT membership welcomed the idea, with the only caveats being expressed as "Can we afford it? Are we stretching ourselves too thin?" Tom indicated that these were AMSAT management concerns too but that the key individuals were very enthusiastic about the concept. He stated that without a dedicated "hardcore" of technical volunteers, AMSAT loses its vitality. Since no further opposition was raised, Tom indicated that further development of the PACSAT concept can be expected.

Since the meetings at Goddard, Den has accepted the position of Project Manager for the US part of the PACSAT project, and several developmental efforts are in the formative stages. ZS1FE has confirmed the South African interest in pursuing the project, and G3YJO has begun "selling" the rest of the payload (which may well be called UoSAT-2). Key developments in the next few months will include ground station design, technology investigations to identify large flyable memories and modem (both MSK and PSK) design, planning for maximum utilization of the Phase-3B designs, conceptual designs of the on-board communications and processing hardware and software and coordination of the roles between the various groups that can contribute to this project.

It is hoped that this satellite will not only give the packet radio experimenters a much-awaited international linking capability, but also provide a new, challenging and unique outlet to the many thousands of new hams who are quite savvy in computer techniques and utilization. The AMSAT team solicits your indications of interest and assistance. This, as with all AMSAT projects, is a volunteer effort -- can we serve as a focus for your creative ideas?

QST DE W3IWI

News Release on Packet Radio Activities
de AMSAT 16 October 82

*** Long-haul Packet Test Successful ***

. . . . . .

On 16 October 1982, from 16:45 UT until 17:00 UT, a successful long-haul Packet Radio demonstration QSO took place between Maryland and Texas; the stations involved were Bob Diersing, N5AHD in Corpus Christi and Tom Clark, W3IWI near Washington. The QSO took place on the 10 meter band at 28.300 kHz with both stations running FSK at a 1200 baud rate using HDLC protocol currently accepted as amateur radio standards.

. . . . . .

This demonstration represents another phase of the AMSAT activities to advance the state-of-the-art in amateur radio communications technology development and the tests were conducted to test the suitability of various existing hardware and protocols under weak-signal and QRM conditions in anticipation of the AMSAT Phase-3B satellite launch in February, 1983, and to help in the planning of future satellite missions including a possible dedicated packet radio mission a few years from now.

. . . . . .

The demonstration QSO took place just one week after a landmark meeting held under AMSAT's auspices to establish and coordinate common packet radio protocols. This meeting in the Washington,DC area was attended by representatives of packet radio groups from San Francisco, Tucson, St. Louis, Washington and New Jersey. The meeting succeeded in reconciling minor differences that had evolved between the various groups during their R&D activities. The goal of establishing common protocols was focused on the upcoming satellite launches when it will be possible, for the first time, for the different packet radio groups to reliably inter-connect local networks on a global basis.

. . . . . .

During the long-haul test, both N5AHD and W3IWI were using special 8085 microprocessor based Terminal Node Controller (TNC) hardware developed in Canada by the Vancouver Area Digital Group (VADG), with software developed in Vancouver, San Francisco and Washington. They both used conventional "202A" FSK modems operating thru 100 watt SSB transceivers. A number of packets were successfully exchanged in both directions and the TNC board's software automatically verified the accuracy of each transmission. The HDLC protocol dictates that if any error is detected, the transmitting station re-tries until an error-free copy is received. In the test QSO, the number of re-tries required never exceeded three. The stations had conducted previous long-haul test experiments through the AMSAT-OSCAR-8 satellite.

. . . . . .

W3IWI has been involved in a number of previous AMSAT demonstration tests including initial feasibility demonstrations using satellites to locate downed aircraft which led to the international Search-and-Rescue Satellite (SARSAT) program and tests of digital phase-shift keying (PSK) techniques to be

employed on the Phase 3 satellite series. N5AHD has developed automated, real time telemetry acquisition techniques for the UoSAT-OSCAR 9 satellite and operates AMSAT's Computer Bulletin Board System (CBBS) which can be accessed at (512)852-8194. Both N5AHD and W3IWI have been frequent contributors of amateur radio software which is available through the AMSAT Software Exchange (ASE). Further information about AMSAT, ASE or AMSAT's CBBS can be obtained by calling the CBBS or by writing:

Special to AMSAT Satellite Report
de Hank Magnuski, KA6M 12 October 82
(minor editorial revisions de W3IWI)

AGREEMENT ON PACKET RADIO STANDARDS!

As part of the October 10th, 1982 AMSAT (Radio Amateur Satellite Corp.) general meeting, president Tom Clark, W3IWI, invited a number of leaders of active packet radio groups to come to a special working group meeting on Friday, October 8th, to discuss the future developments in packet radio activities; specifically, this meeting was intended to discuss AMICON (the AMSAT International Computer Network) for the Phase-3B spacecraft and to discuss a new project (tentatively called PACSAT) involving a low-altitude orbit, all digital store-and-forward transponder. To Tom's

pleasure and surprise, the meeting was well supported and a number of people showed up, representing these groups:

New Jersey - Phil Karn, KA9Q;

Tucson Area Packet Radio (TAPR) - Den Connors, KD2S and Lyle Johnson, WA7GXD;

St. Louis Area Packet Radio (SLAPR) - Pete Eaton, WB9FLW;

Washington (AMRAD) - Paul Rinaldo, W4RI, Dave Borden, K8MMO, Terry Fox, WB4JFI and Eric Scace, K3NA;

Pacific Packet Radio Society (PPRS) - Hank Magnuski, KA6M;

AMSAT - Tom Clark, W3IWI, Jan King, W3GEY, John DuBois, W1HDX and Bob Carpenter, W3OTC.

Even more surprising is that this diverse group managed to agree on some things. In fact, the agreement reached on adopting a common link level protocol may prove to be extremely significant in forming the foundation for U.S. packet radio networking. The meeting which originally was supposed to iron out some AMICON details managed to have much more of an impact. Here's some background on what happened:

A year ago, in conjunction with the '81 AMSAT general meeting, Paul Rinaldo organized the first Packet Radio Networking Conference under the sponsorship of AMRAD, ARRL and AMSAT in Washington (some excellent conference proceedings are still available). Many ideas and some real and paper networks were discussed. In the months which followed quite a few people got their packet radio controllers running and had a chance to experiment, read, discuss and think about various problems involved in implementing packet radio networks. The situation became discouraging. It seemed like a new protocol was proposed for each new set of Terminal Node Conroller (TNC) hardware that came on the air. Each group started heading off in a somewhat different direction. The promise of compatible systems was growing remote. But in this dispersion of effort, people also found out how difficult it was to implement private protocols and how difficult the interconnection would be if common ground wasn't found soon. The different groups also came to realize that there were a common set of problems to be solved and that one area's solution couldn't ignore the requirements of other users. The summer doldrums saw very little activity and not much progress, and provided the background for the AMSAT meeting. This inevitable diversity during the R&D phases for each of the groups had to be reconciled with the impending launch of the Phase-3B satellite in February, 1983.

The AMICON Network

Three major areas of concern filled the agenda of the AMICON meeting: the usage of the Special Service Channel (SSC) earmarked for digital experimentation and called "AMICON" in AMSAT planning documents; the

recommended modulation methods and bit rates to be used on the Phase-3B SSC; and the detailed link protocol to be used for linking ground stations via the satellite.

There was general agreement that standards accepted today must be regarded as developmental. It is to premature to ordain any single scheme at this time. The AMICON concept is not yet a detailed network design, but rather an opportunity to develop a new service for amateur radio. In the developmental phases we may well see many diverse techniques being tested. The meeting discussed the concept that the use of high-altitude satellites for packet radio would be sufficiently complex that it was unlikely that many individual users would be able to muster the resources for individual access. Rather, AMICON would probably evolve as a channel for linking local "concentrator" nodes around the world.

There was a lot of discussion on suitable modulation methods and bit rates that could be supported by Phase-3B. Den Connors and Lyle Johnson of TAPR, Paul Rinaldo of AMRAD, and Tom Clark and John DuBois of AMSAT presented their research findings. Many different modem types were reviewed and international requirements were discussed. After all the debate the following conclusions were reached:

1. The AMICON SSC usage should be restricted to 5 kHz bandwidth (at the -26 dB points). Modem performance must be a primary consideration for any ground station, and the modem used will probably be of a rather advanced design.

2. The use of 202-type modems using NBFM-AFSK will not work.

3. The use of 202 modems using SSB-FSK will produce marginal results.

4. A 400-1200 bps channel speed is probably optimal, as this speed satisfies a variety of different constraints and requirements.

5. The PSK modulation techniques developed for Phase-3B telemetry should be explored at both 400 and 1200 bps.

6. The AMRAD and TAPR groups are going to pursue development of a modem which employs Minimum Shift Keying (MSK). MSK and PSK are considered the most promising methods at this time.

7. The SSC will have to be open for different experimental approaches until there is general agreement and experimental validation of "the" optimum method.

Considering all the alternatives which were discarded, the above resolutions represent a significant narrowing of focus. If that wasn't enough, more was yet to come!

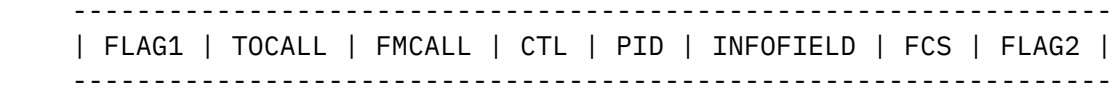
Eric Scace reviewed the work which had been done by the NJ & AMRAD packeteers to adapt the international X.25 protocol to amateur needs. The amateur subset has been documented by Terry Fox, and is now called AX.25. Hank Magnuski distributed a tutorial document on connectionless protocols

and described work which had been done to develop Revision 4 of the TIPM and LIPM software. This is the first implementation of TNC software utilizing only amateur calls (and not hard-wired assigned addresses) for addressing.

By the evening of the October 8, the group began to recognize that only very minor differences separated the AX.25 and LIPM.04/TIPM.04 approaches. The TAPR protocol users were willing to implement an interface based on the recommendations which would come out of the meeting. The differences were resolved and led to the unanimous adoption of a subset of an internationally recognized link level protocol (specifically it is called ANSI X3.66 ADCCP-HDLC BA Class, with options 2, 4, 7, 8, & 11).

Why is this important? First, this link level protocol allows two AMICON ground stations to construct a packet pipeline. This same protocol can be used between two stations in a terrestrial backbone net. The same protocol can also be used for terminal-to-terminal connections, whether direct or via a simplex packet repeater. It represents only a slight extension of the CCITT X.25 LAPB link level protocol. And finally, it does not restrict future development of ISO Level 3 virtual circuit or datagram protocols.

The key feature of the new design is the adoption of a scheme for using call-sign addressing in a packet. The packet format looks like this:



where:

FLAG1	Standard opening HDLC flag byte (01111110)
TOCALL	The destination call-sign (6 char's plus sub-station ID code)
FMCALL	The source call-sign of (6 char's plus sub-station ID code)
CTL	Standard HDLC control byte
PID	Protocol Identification byte for information frames.
INFO	Information field in information frames
FCS	Frame CRC check sequence
FLAG2	Standard closing HDLC flag byte

Frames to be repeated by a local area network simplex packet repeater also contain a third address field following the FMCALL field. This third field is the callsign of the repeater. More details on this protocol will be published in the revised AX.25 specificiation document by WB4JFI et al.

Collectively, the group considered that nearly every link design starts out with a statement something like this: "Holy 807's, look at all the overhead bytes you have in using call signs as addresses. I can do it with just 4 bits." We have found that these other schemes have their own defects and that the penalty for the call sign overhead is relatively small in comparison to other delays on the link and in view of the other benefits. In addition, both amateurs and their regulatory authorities are particularly defensive that the individual's call sign is sacrosanct and

tantamount to being a personal name.

The AMICON session ended with promises from various representatives to try to implement the required versions of this new protocol. In the interim, LIPM.04/TIPM.04 will be available for use by AMICON ground stations until the new software is ready.

PACSAT

The other main topic of the meeting concerned the possibility of a dedicated packet radio satellite. This is discussed in a companion news release from KD2S and W3IWI.

5T5TO is active on all bands on cw. Look for Marc on 3506 kHz at 0600Z. QSL via F6BUM.

_E_a_s_t_e_r_n__K_i_r_i_b_a_t_i_.

T32AB can be found on 10.108 MHz at 0330Z. QSL via N7YL.

_C_r_o_z_e_t__I_s_l_a_n_d_.

FB8WG has been on 10.101 MHz at 1700Z. George will be leaving for France shortly.

_S_o_u_t_h__O_r_k_n_e_y_.

VP8AOE and VP8AOC have been around 14215 at 0100Z. QSL via K0/JW.

_T_r_i_s_t_a_n__d_a__C_u_n_h_a__I_s_l_a_n_d_.

ZD9BV and ZD9YL will be on cw at 1100Z on november 14 at 28745 kHz. Also look for ZD9BX on 28745 kHz on Tuesdays and Thursdays at about 1200Z.

_T_u_n_i_s_i_a_.

3V8AA has been on 28745 kHz at 1300Z operating cw. QSL via IS0/LYN.

_T_a_i_w_a_n_.

BV2B will begin operation on 40 and 80 meters after December First. This will be the first time operation has been experienced on these bands.

_H_e_a_r_d__I_s_l_a_n_d_.

Both groups planning January operations from Heard Island report that everything is going well and permission for licenses and landing have been received from appropriate authority.

I copied this bulletin frame from the Uosat-Oscar-9 2 meter beacon
yesterday afternoon. (Part of the frame was garbled, near the orbital
period section, due to a fade)

Subject: code practice pgms for your terminal
X-Google-Info: Converted from the original B-News header
Posted: Sat Nov 13 00:26:26 1982
Received: Mon Nov 15 07:32:58 1982

In doing some house cleaning, I found these programs that are supposed to
produce morse code using input text or a file. Somebody gave them to me about
two years ago and they have been collecting dust in my uucp directory since.

These programs use the audible bell in your terminal and produce morse code.
I am told that if the duration of the bell is right, running these programs
at 300 baud produces respectable CW.

I hate to throw these away so I am posting them to the net in hopes
that somebody out there can use them for code practice, reading rotated
jokes, or what ever.

I am currently hearing Columbia/Houston communications being relayed on
28.6 Mhz. Part of the problem in hearing them is that the astronauts
have been very quiet. The transmissions do not include the "broadcast
status report" that the 900 number does.

I am looking for any technical articles referencing digital amateur
radio systems. I saw a QST last year (about October, 81) but the issue
is missing from the school library (natch). If anybody knows of packet
systems or especially digitized voice systems, please let me know.
By the way, its great to see there is net.ham-radio, even if it
(like 20 meters) is dominated by DX talk!. 73s

All radio amateurs should be aware of the ARRL's new publication,
QEX, that deals with subjects that are judged to be too technical for
the readership of QST.

QEX is in newsletter format, and consequently, has much less lead
time than QST. The quality of articles is extreme: running from
very good to poor. However, the good artilces far outweigh the poor ones.
I recommend it to anyone interested in the latest work done
by technically inclined radio amateurs.

QEX is $6 for 12 issues (i think). For more information contact
ARRL, 225 Main Street, Newington CT 06111, 203-666-1541.

qst de w1aw
hr propagation forecast bulletin nr 46   from arrl headquarters
newington ct november 15, 1982
to all radio amateurs bt

the solar flux rose from 139 november 5 to 168 on the 12th. in the

same period of the previous solar rotation, beginning october 8, the flux dropped from 137 to 131. values have been higher than in the previous rotation for ten consecutive days, and are expected to remain so for a few more. solar activity dropped off slightly on the 13th and 14th, but is expected to rise again through about the 21st.

based on current solar observation, the outlook is for mildly disturbed conditions in the hf range november 15 through 17. propagation will improve and the muf will be higher november 18 through 22. the 50 mhz band has been open east and west in the lower latitudes, and on transequatorial paths almost daily since late october. if there is to be high latitude east west communication over long distances on 50 mhz this autumn, it will happen after about the 18th, perhaps for the last time in this solar cycle. hf conditions will be more erratic november 22 through 30. propagation below 30 mhz will be generally good in early december.

american sunspot numbers for november 4 through 10 were between 60 on the 5th and 88 on the 10th, for a mean of 76. they will average slightly higher this week ar

No doubt that this article should be addressed to net.flame,
however, I think most of the non-ham net subscribers are not
interested in dits, dahs, and morse code blahs.

(flame on)

The ARRL ruling class (QST, Nov 1982, pg 9) claims the no code license
is "an idea whose time has not come." They base this assertion on the
following arguments:

1. The code requirement is the only proven
   screening device for obtaining competent amateur
   radio operators. Apparently, they believe only
   individuals of the HIGHEST technical and moral
   fiber are able to pass the code exam. Rubbish!!
   We have more appliance operators, lids, and people who
   could not cut a dipole antenna today than ever before.
   I have many technically competent friends (CS types,
   EE's, etc) that are capable of passing a code exam, but
   they would rather spend their time updating their state
   of the art skills. These same people would be very
   interested in experimenting with spread spectrum,
   packet radio, repeaters, etc, and have great potential
   to help advance the amateur state of the art.

2. Amateurs have lost confidence in written exams. We
   can restore their confidence by making the exams more
   difficult. The content of the exams is very easy
   to protect: merely compose each individual exam from
   a data base of several thousand questions, and change
   values in questions which require a numerical answer.
   Say goodbye to Dick Bash and his short cut books.

I understand that the FCC has taken some steps in this direction.

3. Difficulty in self-policing the bands filled with new, and presumably inexperienced or incompetent amateurs. There is no easy solution to this problem; it always has, and always will exist. This attitude akin to arguing against having children because they are too difficult to raise. Also, while more amateurs may mean more potential problems, it also means more amateurs to help in policing the bands.

4. (Non ARRL attitude) Alan M(orse). Amateur: "I passed my 13 wpm code test, so everyone else must." My only comment is that hazing belongs in high school or college.

Some questions I have for the ARRL are what makes a good ham (honey sauce and a little pineapple on top?), and exactly what type of people do they feel we need to attract? Should amateur radio be more than a alternate medium to the telephone for the masses to communicate over? What makes radio amateurs more equal than their fellow citizens when it comes to using the "public airwaves"? Why not use morse code only as a computer communications protocol? In what direction does the ARRL perceive amateur radio should head? Should the ARRL make decisions which contradict popular opinion, for the greater good of Amateur Radio? (Depending on who you listen to, hams are for/against the no code requirement. The ARRL believes it is espousing a majority opinion in coming down against the no code license).

The focus of this entire article is that if we can attract some new technical blood into the amateur service, there are many contributions that can be made to the state of the art. Packet Radio, for example, has not been thoroughly explored by industry; can amateurs invent new routing strategies to deal with selective fading, mobile stations, or networks which can dynamically rearrange themselves to bypass failed nodes, etc.. (Sure, I know a lot has been written, but how many of these schemes are more than ink on a piece paper?) What about using more efficient modulation schemes for packet than NRZ, or FM -- anyone for delay modulation, m-ary PSK, etc? Given the right people, there is much trail blazing to do.. I feel that dropping the code exam in favor of a tough written exam will bring more technical types into amateur radio, and, as a result, the entire amateur service will benefit.

A little note on my background (ammunition for those who will argue for the code requirement): I was able to learn code well enough to receive 18 wpm in about 1.5 months, all while working full time. I passed my advanced class license on the first try. I have operated CW and ENJOYED it (I also have operated RTTY - yet I do not ask that everyone be familiar with this mode as a prerequisite to obtaining a license). Although I frequently disagree with ARRL policy, I am a full member. As for the technical/professional end of things, I am a degreed digital design engineer working with a university research group in the computer networking/distributed processing area.

(flame off)

(return flames encouraged -- send to net.ham-radio).

VS6CX and 9M2FR have been active the last few weeks around 0330Z on 21345 kHz. They have been heard long path on the East Coast. VS5HG is on with W7PHO at 0100Z. QSL to Hassan, Box 980, BSB, Brunei.

_8_0__M_e_t_e_r_s_.

5Z4CS is on 3504 kHz at 2145Z. QSL to GI1VLV.

_1_0__M_H_z_.

VP8ANT, Antarctica, is on 10102 kHz at 0025Z. Amateurs are reminded not to operate in the restricted 10109 to 10115 kHz portion of the 10 MHz band. FCC has been issuing citations to offenders. Amateurs are also reminded that 10 MHz contacts may not be credited toward ARRL awards.

_I_n_d_o_n_e_s_i_a_.

YB0/ADJ is on 80 or 40 meter cw at 1100Z.

_Q_a_t_a_r_.

A71AD has been on 3799 kHz recently, at 0100Z.

_N_e_w__H_e_b_r_i_d_e_s_.

YJ8NMB is active every day on the low end of 10 meter ssb, near 28502 kHz at 2300Z. QSL to Mike via WA2MNM.

_L_l_o_y_d__a_n_d__I_r_i_s_.

Approximately 7000 QSOs were made from J20/DU between October 17 and November 8, half cw and half ssb. Operation from Abu Ail is expected to start about December 2 for a 48 hour period. Operation will be on all bands, near the low ends, both ssb and cw. All QSLs should go directly to the Yasme Foundation, not via any bureau.

_N_i_g_e_r_i_a_.

The Nigerian Amateur Radio Society will operate 5N0/SIF from the Lagos Specialized International Trade Fair from November 20 through 29.

_S_o_u_t_h__O_r_k_n_e_y__I_s_l_a_n_d_.

VP8AH is on 14228 kHz at 0330Z. QSL via K2JW.

_J_e_r_s_e_y__I_s_l_a_n_d_.

GJ3MWR is active on 75 meter ssb. Look for him on 3798 kHz

at 0200Z.

_H_e_a_r_d__a_n_d__W_o_r_k_e_d_.

OE2TWM/YK on 14225 kHz at 0100Z. DF3NZ/ST2 on 28520 kHz at 1200Z. H44SH on 28560 kHz at 2220Z, QSL via AD1S. TL8GE on 14204 kHz at 0345Z.

Phil Karn's recent "no code license" article really hit home with me.

My dad is a ham. I've got a first class radiotelephone license. I've got the money to buy a rig. I'd love to experiment with SSTV, packet radio, AMSAT, and new modulation techniques. I've even got a program for my micro that will teach me the code! But I don't have my ticket.

I've spent a lot of time at hamfests and listening on the bands and am quite certain that I am more competent technically (rf, audio, digital) than a good percentage of the hams on the air today. I understand why the rules are the way they are, but wish there was a way I could get a license without having to learn the code.

For me, learning Morse code has always been a hill that I lacked the momentum to climb. I even sat down (with the program) and learned all the letters once. There has always been something more interesting (and easier) that led me away (CS, EE, relationships, not in that order).

Are there any other technically competent but ticket-less net.ham-radio readers out there? Send mail to me and I'll summarize the repiles.

Bob Van Valzah

I have been reading about the codeless license now for a few months and now feel
that i can make a rational point, Phil you'r right good people are not coming on
board because of the CW requirement. Lets get out of the dark ages!!!!!

Remember, the FCC has already directed its staff to draw up a Notice of
Proposed Rulemaking (NPRM) for a code-free amateur radio license in the
USA. When the NPRM comes out, the FCC will of course be soliciting
comments from interested parties.

The ARRL has come out against the code-free license, as it has many
times in the past, claiming that it represents the majority of its
members. Amateurs are certainly not unanimous however; the editorial
staff of Ham Radio magazine recently wrote an eloquent argument in
favor of the license.

I suggest that the opportunity for the code-free license has never
been better than it will be later this year. Since there seem to be so
many of you out there who wish to become hams, I suggest STRONGLY that
you prepare your comments and send them to the FCC at the appropriate
time. Believe it or not, the FCC really does read and consider the

written comments it receives. Fewer comments are received than you'd expect, so that those who do take the effort are rewarded for their time.

It will be tough to overcome the ARRL's opposition to this issue, but not impossible. The mere fact that the Commission made the directive to its staff indicates a strong positive predisposition. If you want a code-free license, write and say so! Also, post a copy of your final draft to the net.

It has never been made really clear exactly what priviledges a no-code license will bring. If a no-code licensee cannot use the cw portion of the band at all then it does not matter too much what they do. The Canadian so-called digital license only gives priviledges from 2 meters and up. If the American plan is similar to that then I see no problem with a no-code license. But if it also permits use of the cw only portion then it deserves as much opposition as can be mustered against it! I am all for allowing technically oriented people into the amateur service but not if they can muddle around in parts of the band that they have not proved competence in. I personally derive a great deal of enjoyment out of using CW. Computers are my job .. ham radio (and particularly CW) is my HOBBY (no flames please ... I know its supposed to be an experimental service) so I am not particularly interested in packet radio (yet) because it is too close to the stuff I do all day. I also do not have the money nor the technical expertise to get into spread spectrum, satellite work etc.etc.

I suspect the major opposition to non-code is because it is perceived as a threat to the existence of the CW portion of the band .... if the code requirement is dropped far fewer new hams will bother with it and then there will be considerable pressure to reduce the CW portion.
I hope the no-code license follows the Canadian style and only permits no-code from 2m and above.

I suppose this is a good a place as any for this thing......

I want to build a box which will generate the Touch-Tone (tm) tones through a speaker. I eventually would like to use it so I can do touch-tone stuff through a dial phone.

Being the dummy that I am, I know very little about doing something like this. If someone could answer the following questions for me, I'd sure appreciate it.

1) I know there are chips which generate these tones, but does anyone know what the "numbers" of the chips are, and where I can get one (does Radio Shack have them?)

2) Will I need something to amplify the tone the chip produces, or will it be loud enough by itself?

3) Are "A", "B", "C", "D" used that much, or would I be able to get by with just 0-9, *, and #?

4) What's the best way to power this thing? I had thought a 9-V battery would be nice, but if we're talking TTL, it wouldn't be too neat (fry, sizzle).

5) Does anyone have any plans/wiring diagrams/etc. for one of these, or do I gotta figger it out for myself?

Please direct all responses to:

I have been posting the "call book" of net.ham-radio readers for over a year
now. At first, it was a weekly publication. Later, after some complaints,

it became monthly.
It has been several months now since one was posted. However, I am still
getting an ocasional request to be listed in the call book.

A question -- are the net.ham-radio readers interested in the call book
articles? Are they useful? If so, I will gladly continue.
Please reply by mail to ...!npois!jak

I am looking for a small, inexpensive (used) beam for 20
and 15 meters. 10 meters is ok but not necessary.
I have a 10 foot tripod roof 'tower' on which to mount it.
It must be reasonably light weight and not look "too offensive".

Anyone have a used beam around? or know of anything to recommend
that I should look for?

The 23rd Annual CQ-WE Contest will be held on November 13-14, 1982.

Session	EST	UTC	Date(UTC)	Modes
Saturday, November 13, 1982				
1 - A	1400-1500	1900-2000	13 Nov	Novice & HF Tech
B	1500-1800	2000-2300	13 Nov	CW
2 - A	2000-2300	0100-0400	14 Nov	Phone
B	2300-2400	0400-0500	14 Nov	All Modes
Sunday, November 14, 1982.				
3 - A	1400-1700	1900-2200	14 Nov	Phone
B	1700-1800	2200-2300	14 Nov	All Modes
4 - A	2000-2100	0100-0200	15 Nov	Novice & HF Tech
B	2100-2400	0200-0500	15 Nov	CW

All licensed amateur radio operators employed by or retired from Western Electric Co., Bell Laboratories, AT&T Co., AT&T Long Lines, and Bell Operating Companies are eligible to participate.

To encourage novice and technician participation the first hour (Sessions 1A and 4A) of each CW session is reserved for contacting novice and technician stations only. All licensed operators may participate in this period, but one end of the contact must be either a novice or technician.

The contest host is : Steve Wheatley, Indianapolis Works, (317) 352-2442.

Subject: Absurd local laws regarding RFI and Pay-TV
X-Google-Info: Converted from the original B-News header
Posted: Wed Aug 4 22:27:29 1982
Received: Thu Aug 5 06:13:12 1982

If you can, look at the editorial in the August issue of Ham Radio. There are some very scary developments in local and state laws that affect radio amateurs. What follows are just some excerpts:

It is now illegal in California to make or sell "any device or component that could be used in a device that could be used to unscramble pay-TV signals". The way this law is written, you could be arrested for selling a 555 timer IC, because it is possible to use one in an ON-TV decoder.

"In Burbank, Illinois, a suburban Chicago community of about 40,000, the operation of \any/ transmitter that interferes with \any/ TV, 'musical instrument, phonograph or other machine or device designed for the production or reproduction of sound' is now a criminal offense. The penalty is a fine of $25 to $1000 for each violation or each day the violation continues, and those violating the ordinance are also subject to arrest..."

These people need educating FAST. The local hams are planning a court battle; they can use all the support they can get. I would urge people to write the Burbank city council, and the ARRL to urge them to support the fight (according to the editorial, they haven't committed themselves to the challenge yet).

General Message
The project to be developed here in Ottawa for the 1982/83 season, and probably 83/84 as well will be a microprocessor based VHF METEOR SCATTER communications system. Planning for this has been underway since early this year and a test program will commence in early spring '83. Participation in other packet radio projects has been suspended for the duration.

I have just started to wire wrap up the AMTOR project on a card. Who else out there is using AMTOR? I need the ASSEMBLER listing for the 6802 G3PLX software - has anyone got the listing on this side of the ATLANTIC yet? Is anyone really on 14.076 with AMTOR ???? What activity is expected to grow using AMTOR - opinions will be appreciated.

David, W6RAW - Please QSP to your UNIX contacts - I would especially appreciate comments from W8SDZ.

(an open letter to Larry Kayser and others interested in AMTOR)

Larry, i'm responding to your inquiry about amtor, forwarded to me by Steve Robinson, W2FPY.

I have been active on Amtor since May and have found it to be
a wonderful system. I have object code software for G3PLX's
Mk2.2 system. I would be happy to copy a PROM for you. Additionally,
you will find a listing of the object code at the end of this
letter. The source code for the PLX controller is not available.
It has been sold for commercial maritime mobile use.

I encourage you to build PLX's MK2.2 as soon as possible. It is
very easy to get up and provides a well tested piece of
software. Much activity is on 14.075000 (mark) 14.074830 (space).
In about a year i imagine that people will migrate to 14.075085 (mark)
14.074915 (space). This would make amtor channel compatible with
commercial maritime stations.

I have developed an AMTOR controller using a Z80 system. It will
be a bit more flexable than controllers currently available.
Some of the major features include: ASCII or BAUDO terminal interface,
CW id, EEPROM for storage of station particulars, etc.
Mode B is operational, mode A should be working by 9/15, mode L
should be working by 10/1 and first release should be ready on or
before 11/1. Object code software will be available for free
to Radio Amateurs who use it for hobby use. Again, source
code will most likely be unavailable (same problem as G3PLX).

Normally you won't hear much chirping on the 14.075 however
many systems around the world are on 24 hour a day autostart.

Here are some calls and selectve call strings.

```
-----------------------------------------------------
TI3DJT        CHUCK         *TDJT
K4PA     BILL     KRPA
KB6BT         WALT     KBBT
HB9AUK                 *HBAK
G3PLX         PETER         *GPLX
G3VZJ                  GVZJ
A4XFW                  *AXFW
G3RSP/MM           *GRSP
PA0RYS        GER      *PRYS

Please excuse my ignorance, but what is AMTOR ? I have heard
it somewhere before, and this further sparks my interest. If
you want to reply directly or on the net, either is fine.
tnx & anxiously waiting to hear more...Dave WN9NBT pur-ee!wn9nbt

I am new in the area and could use some info. I need to know what 2m repeaters
operate in Central Jersey . I could also use a recommendation on where to
go to buy a mag mount antenna and to get some new crystals netted for my
Genave. I would really appreciate a place in either Somerset county or
in the Princeton area.

I'm looking for Network people whom are also members of TAPR or
otherwise interested in packet radio.

We are putting up a 440/220 Mhz remote CP/M system here in San Diego.
We also hope to have the TAPR beta boards shortly, otherwise our
own Z80 version will be implemented (at least initially). We have
no plans to use the Canadian protocols at this time.

Thoughts, queries, suggestions and comments directly to:

Subject: Phase 3-B Launch Date Set
X-Google-Info: Converted from the original B-News header

Posted: Thu Sep 2 20:49:05 1982
Received: Sun Sep 5 03:46:34 1982

The European Space Agency (ESA) has announced that the launch of Ariane
L-7 carrying ECS-1 and Amsat Phase 3-B will take place on 3 Feb 1983.

No launch time was announced, but from earlier planning documents, there
will probably be two launch windows, each about 2 hours long, centered
around 0200 and 1330 UTC.

The launch of L-7 has been delayed not due to problems with the Ariane
launch vehicle, but to design problems with the ECS-1 spacecraft.

I am looking for a light duty antenna rotor.
Something like the CDR AR22r or AR 40   to turn a TA33 jr.
The rotor must have a "pointer knob" type control box. That is, one where
you turn the knob to the compass setting desired and the rotor turns there and
stops. (as opposed to thos where you hold down a button and watch a meter
till the rotor goes to the desired position.)
Anyone have one for sale?

30 August, 1982

SRI Continues to Help Rescue UO-9

The efforts at SRI International continued throughout the past couple weeks to try and fix the ailing UoSAT OSCAR 9 satellite. The try at communicating with the 70 cm command module failed, and the decision was made to try and activate the 2 m command transponder. Before this can be done, a 2 m feed will be attached to the 46 meter dish and a 2 m amplifier will also be installed. If all went well, 2 m attempts should have begun on 23 August.

Geo-Sync OSCAR Proposal

Cablesat General Corporation, Cocoa, Florida, has submitted a proposal to the Federal Communications Commission to launch two geosyncronous domestic satellites in 1985 or 1986. Aboard the two satellites would also be one each amateur radio transponder. The two birds would be between 60 and 70 degrees west longitude and 140 and 150 degrees west longitude, thus covering the entire continental United States and most of Canada and Mexico. Launch would be aboard a STS/PAM-D flight (Space Transportation System with Payload Assist Module D). The proposal calls for 3.65 to 5.67 GHz uplinks and 3.40 to 3.41 GHz downlinks OSCARs. The system would carry the brand of ARNET (Amateur Radio Network Experimental Transponder).

Ariane L5 Ready

At press time, the launch of Ariane L5 was scheduled for 0230 UTC, 10 September, 1982. AMSAT is planning launch summary nets to inform listeners of the status of L5 after launch. If held, the nets would probably occur at 15 minutes intervals on 21280 kHz at 0300 UTC, 14282 kHz at 0315 UTC, and 3850 kHz at 0330 UTC, all on Friday, 10 September.

The AMSAT Satellite Report is a bi-weekly publication of the
Radio Amateur Satellite Corporation. Material may be quoted
without permission as long as credit is given. Material in
two single quotes (``*'') is taken directly from the bulletin,
while that in double quotes ("*") is an actual statement.

qst de ad7i
hr propagation forecast bulletin nr 36   from arrl headquarters
newington ct september 7, 1982
to all radio amateurs bt

the solar flux average for august was 169. after rising from a low
of 136 on august 23, the flux rose for several days and then went
into a zigzag course centered around 178. both the shape of the
curve and the appearance of the sun thus far in september point to

higher flux numbers in the next few days. a 15 point rise on
september 4 closely parallels the curves for three preceding solar
rotations. there is substantial activity coming around the east
limb of the sun, with little due to be lost around the west limb in
the next few days. thus we have a strong indication that the flux
will peak above 200 during the forecast week.

the bad news is that the high geomagnetic activity, and resultant
generally poor propagation encountered at this point in two previous
solar rotations will be back in force, until about september 10.
this will not be continuous, so watch for brief periods of quite
good conditions at unpredictable times this week. the trend in the
k index given by wwv at 18 minutes after each hour is a good clue to
impending changes in propagation. a value of 2 or lower, and a
downward trend, point to improving propagation on all paths. rising
values mean increased absorption on all but low latitude and
transequatorial circuits. the best conditions of early fall can be
expected about september 11 through 13.   use the propagation charts
in qst for august and september to determine the time of highest muf
on any communications path. during periods of low k index the muf
will be higher than the charts indicate, but the timing should be
accurate.

american sunspot numbers for august 26 through september 1 were
between 101 and 150, for a mean of 130   ar

Subject: Apparent Ariane Launch Failure
X-Google-Info: Converted from the original B-News header
Posted: Thu Sep 9 23:45:31 1982
Received: Fri Sep 10 06:43:26 1982

>From a special Amsat net:
The liftoff of Ariane L5 took place at 02:12:03.33 UTC Sept 10, 1982.

The first and second stage flight appeared to be nominal. However,
expected acquisition at Ascension island was NOT nominal. When
the launcher was finally acquired late, it was apparently not on the planned
trajectory; it appeared lower than expected.

This occurred at about 12 minutes into the flight, about 2 minutes before the scheduled end of the third stage burn.

It is not yet known whether the payload actually made it into an orbit, but even if it did, it is highly unlikely that the two payloads could be placed into the intended geostationary orbit.

It does appear that the problem was either with the third stage engine or with the guidance system; the exact cause is not yet known.

Fortunately (for us), there was no amateur radio satellite aboard this flight. However, it is a foregone conclusion that this apparent failure can only delay the scheduled launch date for Amsat Phase III-B (3 Feb 1983).

X-Google-Info: Converted from the original B-News header
Posted: Fri Sep 10 01:50:08 1982
Received: Fri Sep 10 06:52:24 1982

For the second time, an Ariane rocket has launched a submarine satellite.

Its official; the third stage on L5 shut down early for unknown reasons, and the launcher and its two satellites impacted in the middle of the Atlantic Ocean.

This makes a track record so far consisting of 3 successes (L01, L03, L04) and two failures (L02 and L5).

Does anybody know about the Weslink Metroplex repeater K2KLN on 145.45?
I heard a professional-sounding 45 minute news report on issues
related to ham radio this morning at 9:45am.

Do they broadcast on a regular schedule? Are there more of these
broadcasts around?

Re: Westlink...

  I beleive this 'broadcast originates from the San Fernando Valley, here in
California.

  Several Repeaters repeat same each week (one per week)...

  There IS a telephone number that offers a COMPLETE version of the week...
I will try to obtain same if you request...

         Tony.

O.K. Kids!

Here it is!... WESTLINK 213-465-5550
513-275-9991.

I beleive one of the Hams works at a major T.V. Station and uses the sound room to produce these marvels...

OK-OK-OK-

do a station inspection... pleaded insanity and the judge agreed... he is now seeing a shrink under court order and cannot be on the air even by phone patch)...
WA6LEB (a drunk, got official warning for profanity...)

I KNOW there's more, however, the names and calls eacape me...

So folks, I add that there IS more, LOTS more about '61'... it's exciting,
it's an "animal-farm", it's where to go to have fun (not always clean), it's the MOST PROGRESSIVE REPEATER IN THE NATION!!! It was on '61' that I first
listened to "Radio Morania", the "Arnie Show", "Sick Dick's Show", "Bradie Show", "Thumper-John", and so many more STARS and scum-bags... and 'oh yes, I've GOT to mention the "OK" WARS"...(26 min. (the record) of non-stop "o.k's", where 2 or more can participate)... and "Deep-Throat" (he wants to put it in Millie's butt)...

I'm just a '61' *junkie*... more to follow if you wish... ask how you too can put REAL EXCITEMENT back into your HAM RADIO hobby!... roll over Hertz!!!...

Tony.

A M S A T

S A T E L L I T E R E P O R T

Number 40
30 August, 1982

SRI Continues to Help Rescue UO-9
--- --------- -- ---- ------ -- -
The efforts at SRI International continued throughout the past
couple weeks to try and fix the ailing UoSAT OSCAR 9 satellite.
The try at communicating with the 70 cm command module failed,
and the decision was made to try and activate the 2 m command
transponder. Before this can be done, a 2 m feed will be attached
to the 46 meter dish and a 2 m amplifier will also be installed.
If all went well, 2 m attempts should have begun on 23 August.

Geo-Sync OSCAR Proposal
--- ---- ----- --------
Cablesat General Corporation, Cocoa, Florida, has submitted a

proposal to the Federal Communications Commission to launch two geosyncronous domestic satellites in 1985 or 1986. Aboard the two satellites would also be one each amateur radio transponder. The two birds would be between 60 and 70 degrees west longitude and 140 and 150 degrees west longitude, thus covering the entire continental United States and most of Canada and Mexico. Launch would be aboard a STS/PAM-D flight (Space Transportation System with Payload Assist Module D). The proposal calls for 3.65 to 5.67 GHz uplinks and 3.40 to 3.41 GHz downlinks OSCARs. The system would carry the brand of ARNET (Amateur Radio Network Experimental Transponder).

Ariane L5 Ready
------ -- -----
At press time, the launch of Ariane L5 was scheduled for 0230 UTC, 10 September, 1982. AMSAT is planning launch summary nets to inform listeners of the status of L5 after launch. If held, the nets would probably occur at 15 minutes intervals on 21280 kHz at 0300 UTC, 14282 kHz at 0315 UTC, and 3850 kHz at 0330 UTC, all on Friday, 10 September.

The AMSAT Satellite Report is a bi-weekly publication of the Radio Amateur Satellite Corporation. Material may be quoted without permission as long as credit is given. Material in two single quotes (``*'') is taken directly from the bulletin, while that in double quotes ("*") is an actual statement.

Some more details on the successful salvage effort at SRI which regained control over the Uosat-Oscar-9 spacecraft, which had been unable to respond to commands since April 1982:

The SRI team commanded the beacons off at 22:35 UTC on 20 September, using an enormous amount of effective radiated power on the 70 cm command frequency. The earlier problems with the SRI effort appear to have been due to ground command encoder problems and outdated orbit element sets that gave inaccurate antenna pointing instructions (the SRI dish has a 3 db beamwidth of less than a degree at 70cm). The command encoder glitches were fixed several days ago. On the first pass after receiving a new set of orbit elements, the SRI team succeeded.

As I mentioned in my previous article, the spacecraft appears to still be in good health, and the activities in progress before April (extending the gravity gradient boom, checking out the HF beacon transmitters, TV camera, computers, etc) can continue.

I just received a phone call from Vern Riportella, WA2LQQ, AMSAT Executive VP. Rip informs me that last night, the SRI team using the 150 foot antenna has successfully commanded Uosat-Oscar-9, turning off the beacons which have jammed the command receivers for quite a few months now.

The problem was that no interlock circuit had been provided in the spacecraft to prevent the inadvertent turning on of both the 2 meter and the 70 cm beacons, which desensitized the command receivers also on 2 and 70 cm. Naturally, a mistake was made, and somehow both beacons had been commanded on. The SRI dish, plus a kilowatt of transmitter power, was finally able to override the strong local signal in the command receiver (probably on 2 meters, but that hasn't been confirmed) and turn off a beacon to allow commanding on that band.

Initial telemetry reports after the two-meter beacon was turned back on and telemetry encoding enabled indicate that the spacecraft is still in excellent health.

Uosat-Oscar-9 may be received with a conventional amateur 2-meter
receiver on 145.825 mhz FM. If you have a Bell 202 (NOT 212) modem and
a conventional terminal, you can decode its telemetry. Just connect the
terminal to the modem and set the terminal to 1200 or 300 baud,
depending on the current telemetry speed.

Subject: FCC digital radio rule changes
X-Google-Info: Converted from the original B-News header
Posted: Mon Sep 27 22:33:45 1982
Received: Thu Sep 30 11:29:08 1982

Word has it that the FCC has released a rule change effective 28 October
that relaxes the limitations on digital emissions in the amateur
service.

The new limits will be as follows:

bands	max bit rate	max bandwidth
10m	1200	
6,2m	19.6K	20khz
1.25m+up	56K	50khz

The new rules also allow non-ascii codes to be used, provided that both

stations in a contact are within the USA. (Don't ask me why.)

More info as available.

Have problem with interference of a kind I have not seen reported
before. I have an ADM5 terminal at home which I and my kids use to
play rogue etc. My rig is in the same room and if I transmit,
the phone line drops instantly .. much to the annoyance of my daughter
(age 7) who happened to be on level 10 with a large chunk of gold!.
This did not happen when TTY was HP2640 (in fact reverse problem -
it produces prodigious amounts of RFI) and using the same acoustic
coupler. Any ideas as to cause and, better still, a cure (cheap!).

qst de ad7i
hr propagation forecast bulletin nr 40   from arrl headquarters
newington ct october 4, 1982
to all radio amateurs bt

the solar flux started rising september 19, at 137. except for two
brief dips, it continued upward to 218 on october 3. this was the
highest flux reading since july 14. as expected, this produced the
best propagation on 21 and 28 mhz in at least five months. it also
pointed to improved prospects for 50 mhz dx during the next two solar
rotations. most likely periods would be october 28 to november 2 and
november 25 to 30. more detailed predictions will be given in
subsequent bulletins.

one of the most severe geomagnetic disturbances of this solar cycle
began september 5. a recurrence of this event is likely between
october 4 and 7, probably at lower levels than in early september.
watch for exceptional transequatorial propagation on the higher hf
bands, and possibly on 50 mhz, in this period. when it subsides,
there will be good to excellent conditions on all hf bands through
the middle of october. the solar flux will be too low for good 50
mhz prospects at this time, but frequencies below 30 mhz will be
quite good.

the solar flux is expected to be lower during the forecast week,
probably dropping to 150 or lower. this should make for good
accuracy in the use of the current qst propagation charts.

american sunspot numbers for september 23 through 29 were between 96
on the 23rd and 172 on the 29th, for a mean of 132 ar

This year's Simulated Emergency Test will be held the weekend of 16
and 17 October. For those of you who don't know about or are unfamiliar
with the SET, it is an annual drill, usually held during some weekend in
October, designed to prepare traffic nets of the Amateur Radio
Emergency Service (ARES) and National Traffic System (NTS) for
operational during a local, state, or national emergency (though
we all hope that those conditions will never occur.) Member nets
usually hold extra drill sessions in addition to or replacement of
regular sessions, and they receive points for each person that checks
in and for each piece of traffic passed. If you have never participated
in a traffic net, this is a perfect opportunity to experience it and
see how you like it. You will not be required to pass or take traffic,
but if you want to, all the better! If you do not know of any local
nets, ask amateurs around your area for information.

Note to all New Jersey amateurs:
If you live in or near the Union County area (Union county and all
surrounding counties) or plan to be there during SET weekend and want
to participate in the SET, the Tri-County Emergency and Traffic Net
(TCETN) will be holding sessions at 0930, 1230, 1530, and 1930 EDT
on both days (the 16th and 17th). Operating frequency will probably
be 147.255 MHz (TX +600 kHz) during all sessions, but if it will be
different for any sessions, I will post a note here before the SET.
Please feel free to check in at any time; the sessions do not run
long.

If you want more information, please mail me at ...!research!sjb
Hope to see you on the air.

73,
Adam

In my rampage about the VK/ZL contest this weekend, I forgot

to mention the Radio Society of Great Britian 21/28 MHz SSB
Contest, 0700 to 1900 Z Sunday October 10. The contest
exchange is the RS report and a progressive serial number,
beginning with 001. Basically, the intent is to
work G, GD, GJ, GM, GU, and GW prefixes, all of which are
DXCC countries.

I realize that many of you already have this info from
QST, CQ, the DX papers, or whatever. Is this of interest on the
net, however, or is it "redundant"??? Hopefully, the information
here sparks some interest in those who are not aware of the contest,
yet hear some of it over the weekend, and work a few contesters because
the know the exchange format, or whatever. Comments???

At least two good DX contests this weekend (3 if you are into RTTY)
and heres the scoop:

WA-Y2 Contest, from 1500Z Oct. 16 until 1500Z Oct. 17. Phone and cw,
10 to 80 meters. Exchange signal report and serial number, starting
with 001. The Y2 station will send signal report and a 2 digit number
indicating "kreiskenner" (not sure if this is equivalent to a county
or what). The object here is to work as many German Democratic Republic
stations (Y2xxxxx to Y9xxxxx) as possible. These operators
are usually pretty big into contesting.

21 MHz CW Contest, from 0700Z to 1900Z Oct. 17. The idea is to work as
many Radio Society of Great Britain (RSGB) members as possible in the British
Isles. Exchange RST and serial number (beginning with 001). I heard a lot
of British stations on last weekend in the SSB contest, including all of
the DXCC countries from Great Britain.

RTTY Sweepstakes, 0200Z Oct. 16 till 0200Z Oct. 18. Exchange signal report,
UTC time, and CARTG (Canadian Amateur Radio Teletype Group) zone.
Use all bands 80 to 10 meters.

GOOD LUCK!!

Besides the SEC, which has been posted on the net, there
are some "stateside" contests this weekend. Below

is a summary. These contests can be a lot of fun, and
sure can help your 5 band WAS.

MINNESOTA QSO PARTY

>From 1700Z Oct 16 till 2259Z Oct. 17 on 80 to 10 meters, both phone
and cw. Work stations from MN once per band and mode. Exchange
RS(T) and ARRL section, MN stations exchange RS(T) and county. Suggested
frequencies phone:3.933, 7.233, 14.300, 21.433, 28.633, cw 33 KHz up from
band edge.

PENNSYLVANIA QSO PARTY

1700Z Oct. 16 till 0400Z Oct. 17 and 1300Z till 2200Z Oct. 17.
Exchange RS(T), serial number (starting with 001), and ARRL
Section. PA stations exchange RS(T), serial number, and county.
Frequencies: phone 3980, 7.280, 14.280, 21.380, and 28.560, CW
40 KHz up from the bottom, Novice 10 KHz up from the bottom.

This weekend's contest outlook is a bit bleak, as
the "big guns" are resting up for next weekend's
CQ Worldwide SSB contest.   However, this weekend
offers a good chance for those of you who want to
check out the rigs, that 4 element 40 meter mono-
bander at 150 feet, that 10 mile long wire, etc..

MARYLAND - DC QSO PARTY

>From 1800Z Oct. 23 until 2100Z Oct. 24. Work stations
once per band and mode. Exchange serial number, signal
report, and QTH (county for MD stations, state, country
or province for others). Frequencies: 3.950, 7.250, 14.290,
21.390, 28.590; cw, 60 KHz up from bottom, Novice, 20 KHz up
from low end.

ARRL MIDNIGHT SPECIAL

>From 0300 to 0500Z Oct. 24   First hour, 160 meter cw, second
hour 160 meter phone. Work stations once per mode. Frequencies:
cw-1805 to 1820 phone 1855 to 1870. Exchange antenna type
(G=ground plane, V=vertical, O=loop, L=inverted L, W=wire, long
or otherwise, D=dipole, I=inverted V; use ur imagination for others!)
and power input to final.

As always, gud luck, es I will post the CQWW rules later today!

Subject: Amsat news
X-Google-Info: Converted from the original A-News header

>From the 11/16/81 issue of Amsat Satellite Report, and the Amsat nets:

Work on the liquid fuel kick motor design for Phase III-B is
progressing well. Recent pressure tests in Germany have satisfied
ESA (the European Space Agency, who will launch the Ariane
carrying Phase III-B) that the fuel tank design is sound.

Phase III-B will use a UDMH/Nitrogen Tetroxide engine originally
manufactured by MBB for the Symphonie satellite program and donated
to Amsat.
The liquid fuel motor will allow a larger payload, consisting of an
extra transponder for 23cm -> 70cm, increased radiation
shielding for the onboard computer memories, and a better
Molniya-type orbit.

The next launch of an Ariane (L04, the 4th test flight) is scheduled
between 20 and 23 Dec 1981. A maritime communications satellite
called MARECS A will be aboard LO4. Phase III-B is currently
expected to fly on L7 (the 7th Ariane, an operational mission)
in October 1982 along with the ECS-1 spacecraft (European
Communications Satellite 1).

Still no word on the expected launch of 3 new Soviet amateur radio
satellites. Anyone hearing the new birds is urged to call Amsat
headquarters at 301-589-6062.

Engineering evaluation work on Uosat-Oscar-9 (launched 6 October) is
progressing well. The speech synthesizer and both computers have
been tested and found to be operational. It is expected that despin
maneuvers using the torquing electromagnets will begin within a week
or so. Following this, the gravity gradient boom may be deployed,
and the HF beacon experiments turned on.

Macquarie Island and Christmas Island.

VK0AN and VK0AU on Macquarie Island and VK9XW on Christmas Island are scheduled to show up on Tuesday 24 November on 14332 kHz at 1000Z. A list to work these stations may be taken earlier than 1000Z.

Galapagos Islands.

HC8MD will be on the air through 12 December on all bands from 6 through 160 meters. Check 7006 kHz at 0300Z and 3795 kHz where he may be listening up on 3825 kHz at 0400Z. He also has a 6 meter beacon with the call HC8VHF operating at 51.1 MHz. QSLs go to Box 665, Cuenca, Ecuador.

New Hebrides.

Ron, ZL1AMO, is now signing YJ8RW through December 5. This is an all band both cw and ssb operation. Check 28023 kHz at 0000Z and 28552 kHz at 0100Z. Ron is still trying to obtain the necessary permission to operate from Kermadec Island.

Crozet.

FB8WG can often be found on cw on 14110 kHz around 0300Z. There is a list operation run for FB8WG on Mondays and Thursdays on 14225 kHz from 1200 to 1230Z.

Taiwan.

Tim, BV2A, keeps a Saturday schedule with W7PHO at 1400Z on 14225 kHz. Look for Tim also on Sundays at 0000Z on 28575 kHz.

_____
160 Meters.

Amateurs in Norway, LA, have received permission to operate on 160 meters and will be on for the CQ WW DX Contest, which is sponsored by CQ Magazine. Look for the Norwegians between 1810 and 1840 kHz. OA4AWD is on 160 meters most weekends on Friday and Saturday after 0400Z around 1803 kHz. QSLs for OA4AWD go to VE2AQS. Also on 160, ZS6DW keeps a regular schedule with VE3BBN. Check 3777 kHz at 0315Z.

_____
Trinidad.

Iris Colvin, W6QL, has been operating as 9Y4KG at 0415Z on 3802 kHz. QSLs will be handled by the YASME Foundation.

_____
80 Meters.

KP4KK/DU2 in the Republic of the Philippines has been worked by many stations in W2 land from 1100 to 1200Z. Also look for A71AD in Qatar on 3799 kHz around 0315Z.

_____
Kenya.

Kati, JE1JKL, will be operating station 5Z4CS on five bands for an extended period of time on both ssb and cw. Kati has applied for the necessary licenses to operate on 6 and 160 meters also. QSLs go to JI1VLV.

_____
Heard and Worked.

FH8OM on 28530 kHz at 1600Z. 9Q5FL on 28615 kHz at 1700Z. 9Q5VT on 21316 kHz at 2330Z, QSLs to K5VT. TA2KS on 14225 kHz at 0315Z, QSLs to G3SCB. WB0ICS/KH7 on 28645 kHz at 2330Z. 7P8BX on 21282 kHz at 1900Z.

Subject: wanted: marine SSB Tranceiver or ham/sailor
X-Google-Info: Converted from the original B-News header
Posted: Wed May 12 13:13:43 1982
Received: Thu May 13 01:00:02 1982

The Cruising Club of America Newport/Bermuda race committee, in its
infinite wisdom, has decreed that all boats this year will need a single
sideband radio on board. If the radio operates in the ham bands, a licensed
operator is also required. We're reluctant to spend the $2000 to $5000

required to buy a new marine SSB transceiver. So we're in desperate need of either:

  1) A really cheap marine SSB tranceiver - new or used, borrow, rent, or buy - it needn't necessarily be operable - we'll fix it, or

  2) a licensed ham with (preferably offshore) sailing experience to go along on the race. We've located a ham tranceiver we can borrow. The race starts June 18 at Newport, Rhode Island. On average the trip takes five days though there's no guarantee. The boat is a C&C 35 with a fairly good record in previous races (a 2nd, a 4th, and a 5th in class). This boat is "campaigned" on a tight budget (i.e. expenses are shared, pay your own air fare back or sail back if you like) but we eat well.

If you can help, please reply by mail or call (201) 386-2390 (days), (201) 267-4377 (evenings).

pr propagation forecast bulletin nr 19 from arrl headquarters newington ct may 10, 1982
to all radio amateurs bt

the solar flux was 150 or lower daily april 30 through may 8, the longest such low in several years. combined with above average geomagnetic activity and normal seasonal changes, this made for generally pooc dx conditions in early may. geomagnetic activity dropped to more favtrable levels after may 6, bringing much improved propagation through may 8.

higher geomagnetic activity is expected to degrade high level propagation may 9 and 10, but dx conditions should improve may 11 to 13. the solar flux is likely to be higher this week but it will not be a major propagation factor. the flux has been 186 or lower for 39 days, but this is not a unique drop in solar activity and an almost identical low came in may and june of last year.

american sunspot numbers for april 29 through may 5 were between 101 and 53, with a mean of 69.4. these are the lowest numbers since june of last year ar

Number 32
10 May, 1982
-- --- ----

Dayton Hamvention
------ ----------
Almost 30,000 people flocked to this year's Dayton Hamvention. At noon Saturday, the AMSAT Forum started. Features included a slide show of the history of the Phase IIIB fuel tank and a question and answer period that many felt deserved much more time than the 90 minutes allotted it.

Trinkets were quickly sold out: Hams-In-Space T-shirts and decals among them. A TV monitor displayed a production by AMSAT, and its crowds stayed until the end. Donations to AMSAT went over $4500. New equipment was offered to the eagerly awaiting throngs of hams. Manufacturers included Ten-Tec, Microwave Modules, Cushcraft, KLM, Advanced Receiver Research, Lunar, and Spectrum West. [The article goes on here to describe some of the new items, but, so that I will

in no way use USENET to advertise companies' products (uh...the above list was just a list of who was there...ahem), I will refrain from summarizing that part --Adam]

RS May Day Announcement
-- --- --- ------------
The RS-7 bulletin board started to convey to the public on 29 April concerning the May Day celebrations in the USSR. The translation provided reads: ``CQ DE RS7 PSE (send your messages) 2 MAY at 1200 Moscow local time on 14282 kHz.'' No interest in outside participation was hinted.

More Net Listings
---- --- --------
The following net listings come from England and are being conveyed to ASR readers in the case that they will take interest in them:

Net Name	Day	Time	Frequency
AMSAT UK 80m	Wed.	1900Z	3780 kHz
AMSAT UK 80m	Sun.	1000Z	3780 kHz
AMSAT UK 2m	Sun.	1930Z	144.280 MHz SSB
AMSAT UK 70cm	Sun.	1800Z	432.210 MHz SSB

The AMSAT Satellite Report is a bi-weekly publication of the Radio Amateur Satellite Corporation. Material may be quoted without permission as long as credit is given. Material in two single quotes (``*'') is taken directly from the bulletin, while that in double quotes ("*") is an actual statement.

Here's some information from the Amsat net this evening:

The payload booted out the door of Salyut-7 is identifying itself as
"RK02" on 29.58 mhz. [What happens when they get to RK05, 6, etc?
Do they have clearance from DEC? -hi-] It is not yet known if this
payload has a communications transponder.

Telemetry format is similar to the RS-[3-8] series already in orbit:
5 groups of 4 characters each.

The current orbital period of RK02 is 91.349464 minutes and it is
crossing the equator 22.226506 degrees further west on each orbit.

Due to the VERY low orbit, this period will decay rapidly.
For example, the average period tomorrow will decrease to 91.345922
minutes.

Equator crossing times and longitudes:
18 May 00:32:29 UTC @ 237.1 W
19 May 00:54:02 UTC @ 248.7 W

Phil Karn, KA9Q
Bell Labs, Murray Hill

PS. I would like to get some guidance as to whether information on
amateur radio satellites should be double-posted to net.space and
net.ham-radio, since the amateur space program spans both subject
areas. Reply directly to ME, please, and I will abide by the majority
opinion; I don't want to start up a big public controversy. Thanks.

hr propagation forecast bulletin nr 20 from arrl headquarters
newington ct may 16, 1982
to all radio amateurs bt

the solar flux was 150 or lower thus far in may, and it hovered

around 130 may 10 through 15. sunspot counts are the lowest in about four years and they are expected so through about may 19.

low solar activity and the normal drop in muf at this season have taken their toll on 21 and 28 mhz. neither band will be consistently good for high latitude communication until days become shorter in the northern hemisphere.

sporadic e ionization has become common and short skip openings have been frequent on 21 and 28 mhz. skip was observed on 144 mhz on may 15, with the peak of the e skip season still at least a month ahead.

lower and more stable solar activity have helped to improve propagation on 14 mhz and lower frequencies, but disturbed conditions were developing as this bulletin was issued. the balance of may is expected to bring poor propagation on all dx frequencies.

american sunspot numbers for may 5 through 12 were between 80 and 54 with a mean of 69 ar

Subject: Amsat news from 3850 Khz net
X-Google-Info: Converted from the original B-News header
Posted: Tue May 18 23:27:55 1982
Received: Thu May 20 02:02:51 1982

More information on the new Soviet amateur radio satellite, from the regular Tuesday night Amsat net, 9pm EST on 3850 Khz:

Keplerian element set #43 for Salyut-7, catalog number 13138:
Epoch: 1982 135.23118989
Mean anomaly at epoch: 55.8167 degrees
Inclination: 51.5941 degrees
Eccentricity: .0002452
Mean motion: 15.75128484 rev/day (a VERY low orbit!)
Drag factor: .0003028 rev/day^2 (an order of magnitude worse than Uosat)
Arg of perigee: 304.2741 deg
Right ascension of ascending node: 20.6840 deg
Epoch rev number: 403

>From these numbers, the period is 91.345922 minutes, the apogee is

346km and the perigee is 343km. Because the orbit is so low, it will be difficult to predict long periods in advance. It will probably have a very short orbital lifetime.

For at least a while, these elements should be a close approximation to the orbit of the amateur sub-satellite. Depending on how hard the cosmonauts kicked the spacecraft out the door, the two spacecraft orbits will diverge slowly or rapidly with time.

It is believed that the spacecraft carries a transponder with a 21 mhz (15 meter) input and a 29 mhz (10 meter) output. If so, this is the first time the 15 meter band has been used for such a purpose. The beacon on 29.578 Mhz has been received by a number of stations and is quite strong.

In other news, Uosat is still in trouble. Both beacons are still locked on, densensing the command receivers. Attempts at both 2m and 70cm moonbounce stations to command the beacons OFF have not yet been successful, although attempts are being continued.

ESA has set a launch date for Phase III-B in January, 1983, aboard Ariane L7. The primary passenger will still be ECS-1; problems with the design of ECS-1 has been the cause of the delay. The phase-IIIB spacecraft itself is nearing completion, as the transponders will be arriving from Germany this week. The spacecraft will start environmental testing within the next several weeks.

Amsat Software Exchange - available programs

The W3IWI orbit prediction program is available in the following versions and distribution media:

1. TRS-80 model I - level II basic. (l,c,d)

2. North Star BASIC under North Star DOS for 5 1/4 inch hard sectored diskettes. (l,d)

3. Microsoft BASIC version 5.21 under CP/M for 8 inch single density, soft sectored diskettes. Also available in 5 1/4 inch diskettes for use with Cromemco systems. (l,d)

4. Apple/II Applesoft Basic on either 13 or 16 sector diskettes. Specify 13 or 16 sector. (l,d)

5. PL/I-80 version 1.3 under Cromemco CDOS or CP/M single density 8 inch, soft sectored diskettes. Also available in 5 1/4 inch diskettes for use with Cromemco systems. (l,d)

6. Ohio Scientific for OS65U and OS65D versions 3.2 and 3.3. Specify version. (l,d)

(l) indicates that hardcopy listing is available.
(c) indicates that cassette tapes are available.
(d) indicates that diskettes are available.

If you request a version that is not available we will send you the closest thing we have. If a diskette is ordered a listing will not be sent unless you specifically order one in addition to the diskette.

We have other versions under development that are not yet ready for distribution. See this bulletin board, ASR, and/or ORBIT for information about new versions.

Thank you for your interest and support of AMSAT and ASE.

I guess I should also inquire as to what class of license you hold. (It would be useful to know what percentage of Tech's use the HF CW bands, How many Extra's use their exclusive segments, etc).

A Local Area planning meeting to discuss several advanced
aspects of Amateur Packet Radio is tentatively scheduled to
be held in Murray Hill New Jersey, on Saturday, June 19th.

The major purpose of this meeting will be to allow different
local groups to make their views and requirements known
before networking between adjacent areas takes place.
Everyone is welcome. Additionally, groups and/or
individuals are invited to make presentations to the group.
The meeting will conclude with a general discussion.

Space is limited so if you wish to attend please register
with one of the people listed below by Wednesday, June 9.
We cannot accommodate anyone who does not register on or
before June 9th.

Well, for what it's worth:

The Technicians Ten Commandments

(reprinted from The Resonator (Whippany BTL ARC) reprinted from Superstition ARC)

1. Beware the lightning that lurketh in the undischarged capacitor lest it cause thee to bounce upon thy buttocks in a very untechnicianly manner.

2. Cause thou the switch that supplieth large quantities of current to be opened and so tagged, that thy days in this earthly vale of tears may be long.

3. Prove to thyself that all circuits that radiateth and upon which thou worketh are grounded and so tagged lest they lift thee to radio frequency potential and maketh thee to radiate also.

4. Tred not among the foolish that engage in intentional shock for they are surely non-believers and are not long for this world.

5. Take care that thou useth the proper methods when thou takest the measure of a high voltage circuit lest thou incinerate both thy self as well as thy meter.

6. Tampereth not with the interlocks and safety devices for this will surely bring the full wrath of the safety inspector upon thy head.

7. Work thou not on energized equipment for if thou do, thy fellow man will surely buy many beers for thy widow and all will console her in other ways.

8. Service thou not equipment not alone for electrical cooking is a slothful process and thou might sizzle upon a hot circuit for many hours before thy maker sees fit to end thy misery.

9. Trifle thou not with radioactive tubes and like substances lest tho begin to glow in the dark yea as the lightning bug and thy wife have no further use for you except thy wages.

10. Causeth thou to be tagged all modifications made by thee upon any
    equipment lest thy successor tear his hair assunder and go slowly mad
    in his attempt to decide what manner creature hath wrought such a nest
    withing the wiring of said equipment.

          (attributed to Bert, W2GOB)

                                    Good advice?!?

         HAM SURVEY RESULTS
         --- ------ -------

Thanks to those who took the time to respond to my survey.
There were only 8 who did. In order to get enough input
I handed out forms at our local radio club this past Tues
night. The results were as follows:

1) License Classes: 4% Tech, 30% Gen, 44% Adv, 22% Ext

2) Favorite Mode: 52% SSB, 30% CW, 18% said 50-50.
     These figures were also true for the Gen and
     Adv classes individually. Extra Class alone
     said 28% SSB, 46% CW, and 28% both.

3) Of those preferring CW, only 50% have narrow
   (500 Hz or less) filters, either IF or audio
   types.

4) Only 16% use linears: 0% Gen, 14% Adv, 45% Extra.

5) Average time license held:
Gen 13 years, Adv 13 years, Extra 6 years.

6) Favorite Bands:

	Most Fav.	2nd Fav.
Gen.	40	10
Adv.	20	40
Extra	20	40

The least favorite band is 80. (No extras liked 10 or 80, only one likes 15).

7) DX operation:

No.	Time wkg DX
42%	none
42%	50% or less
16%	51% or more

8) 74% of the Tech, Gen, and Adv want to upgrade.

9) New Modes: (What would you like to try?):

MODE	No.
RTTY	32%
SSTV	10%
CW	2%
Packet	2%
HF-FM	2%

10) Changes wanted to present HF bands:
26% say "lower the maximum power to 250 watts".
74% had no comment on power levels.

30% want the phone bands expanded.
6% said don't expand phone bands.
64% had no comment on that.

11) Future 10 MHz band:
81% say limit power to 250 watts.
9.5% say 500 watt limit.
9.5% say 1Kw limit.

58% want CW, 20% SSB, 14% RTTY, 6% no comment.

10 MHz classes: 50% say Gen and above, 32% say Adv and above, 14% said "all", 4% say Extra only.
NOTE: The 4% that said Extra only were Adv class!!
Guess they want some incentive to upgrade...

(73% of the Extra class responses favor that the 10 MHz band be used by Gen and above classes).

- -

By the way, regarding item 1, according to the call book,
the U.S. figures are:

```
     Novice    18%
     Tech.     20%
     Gen. 30%
     Adv. 24%
     Extra      7%

               -73- K9EUI  we13!rjr

Number 34
31 May, 1982

ISKRA 2 Kicked Out the Door
----- - ------ --- --- ----
On 19 April, 1982, the USSR launched space station (then unmanned)
Salyut 7. On 13 May, two cosmonauts were launched aboard the new
Soyuz T-5 booster, and they docked with the station the following
day. At 1107 UTC, 17 May, they opened the airlock of the station,
and out flew ISKRA 2. However, the bird cannot seem to turn its
transponders on due to the same desensing problem that is preventing
UoSAT officials from turning one of the UoSAT transponders off.
The ISKRA satellite will have a short life, spending a maximum of

six weeks in space before falling into the atmosphere and burning up.

According to TASS and others, ISKRA 2 contains a transponder for amateur radio, memory device, command radio channel, and a telemetry encoder for the relaying of scientific information and data about the operation of the other equipment. A malfunction in the command decoder has prevented officials from turning on the transponder. The transponder band is 21.230-21.270 MHz uplink and 29.580-29.620 MHz downlink; the beacon is at 29.578 MHz plus/minus Doppler shift. Transponder output power is around 1 watt; the beacon can ``be operated at 300 mW or 1 watt ...''

ISKRA 2 is like AMSAT OSCAR 7 physically, employing the cylinder with hexagonal cross sections; each side is covered with solar cells. Dimensions are approximately 50-60 cm tall by 30-40 cm wide, weighing 28 kg.

Phase IIIB Nearing Completion

On Thursday, 20 May, the AMSAT DL crew landed at Washington National Airport with Phase IIIB's main instruments: the Mode B and L-transponder. By the following Sunday, most of the boxes had been secured to the spacecraft, and it was readied for a full power-up test. After that, the bird will be subjected to the thermal vacuum test at Goddard Space Flight Center

AMSAT to Run UN Station

The United Nations has requested that AMSAT help in establishing a Mode J station at the UN Secretarial building, New York, New York. The station now there operates Mode A by the call 4U1UN. The station needs the ``systems engineering, software and training.'' W2RS will be the Project Officer. No explicit deadline has been set for completion of the station, but Autumn is seen as a tentative period to shoot for.

ASE CBBS

The Amateur Software Exchange Computer Bulletin Board System is up and running fine, reports N5AHD, system operator. 20 users have checked in, and 100 messages have been generated in its first few weeks. Points to keep in mind for its use:

1) It will likely be up evenings and weekends. Published up-times are to be considered as minimums.

2) If you run into difficulty, contact N5AHD at:
   Bob Diersing
   4129 Montego
   Corpus Christi, TX

78411
(home) 512-852-3196
(office) 512-991-6810, ext. 289

3) ``Orbital data is most often updated on Thursdays or Fridays.''

4) Type '?' to get a brief list of instructions or 'F' (giving
'INSTR' as the file name for the full description of commands.

I have always been interested in ham radio, even to the point some years ago of becoming proficient in Morse code. I am not a wizard with electronics, although I can read schematics so long as they don't have anything to do with tubes. I would like to be able to dabble with 2-meter gear, and maybe have some fun with long-distance stuff. I've read a couple of the ham license manuals (old ones).

My question is this: I would like to get a Tech license. Do I have a long way to go? Will I be forced to learn anything substantial about RF? What's the easiest route for me to pursue? I've wanted to do this for years, but could never figure out the best way. Any help people could provide would be welcomed. Thanks,

Rick

Has any ham or shortwave listener out there picked up broadcasts from Radio Venceremos, the radio of the rebels in El Salvador?
If so, time and frequency information would be greatly appeciated.

I am looking for a good short-wave-listening receiver to pick up international broadcasts. I have heard some good things about the Yaesu FRG-7700. Can anyone

- tell me more about the Yaesu

- suggest good alternatives that are cheaper

- recommend a good antenna setup to go with a SWL receiver.

Thanks,
Bob Warren

I have come across a copy of the various frequencies used by the
casino's and other operators along the boardwalk in Atlantic City -
it's real interesting, if you happen to have a programmable uhf scanner
(almost everybody is up on 450). The freq's are public knowledge, but
this is the first list i've seen that has AC all together in one place...
If anyone is interested, mail me a request, and Ill be happy to Mail it
along (list is long, so I don't want to clutter up netnews)
Good Luck if you go down (or up or over),
Mike wb2rpc

hr dx bulletin nr 26 from arrl headquarters
newington ct june 25, 1982
to all radio amateurs bt

thanks to k1mem, k1mm, w1trc and n1ajo of the southern new england dx assocation for the following dx information.

st. paul island. the dxpedition to st. paul island by ve1ai, ve1asj, ve1fh, ak4l, k1wj, w1gnc, and w1xx is set for 8 july through 13 july. the callsigns used will be ve1spi and ve1cer. alt band, 160 through 2 meter operation is planned. modes to be used include cw, ssb, rtty and 2 meter eme. qsls will be handled by ve3euf and a u.s. self addressed stamped envelope is ok.

lebanon. od5lx is active after 0100z around 14025 khz. teds qsls go to sm0djz.

ecuador. hc1md/5 will be leaving ecuador in 30 days. look for rick on 21347 khz afer 0000z to arrange schedules for 160 meters or other bands. qsls go to k8ljg.

west kiribati. look for t30at at 1000z on either 14205 khz or 14025 khz. send teds qsls via g3xzf.

oman. a4xjo can often be found on 14211 khz at 2030z. qsl via wb3jru.

greenland. xp1ab has recently been g
ving out that rare prefix.
look for him on 14205 khz betwen 2200 and 0300z. qsls go to wa2tti.

aland islands. oh6vm/oh0 is usually on 14201 khzafter 0200z.

rodrigues island. 3b9cd can be found on 14027 khz at 0300z. qsls go to 3b8cf.

svalbard. look for jw6zw on 14025 khz at 0230z. jw0p likes 21020 khz at 0300z.

chatham islana. check 3795 khz at local sunrise for [xmission error].

st. vincent. look for k5yy/j8 on either 7005 khz or 14030 khz
after 0300z. qsls go to k5yy.

wake island. kw6hf, qsl manager for ah6dy/kw6, advises that
ah6dy/kw6 may be worked between 0520z and 0700z. initial
contact is established on 14314 khz, the pacific maritime
mobile net frequency. he then moves with his qsl manager to the
nearest available clear frequency ar

Received: Mon Jun 28 07:16:11 1982

To any who are interested in monitoring shortwave broadcasters, general SWL'ing, and DXing (inspired by the recent inquiry about Radio Venceremos):

The best source for up-to-the-minute information as to frequency and times of broadcasts for all the non-standard stations (clandestines, pirates, harmonics, etc.) and changes to the schedules of the regular SW broadcasters can be gleaned by listening to Glenn hauser's "DX News" segment on Radio Canada International's Shortwave Listener's Digest program each weekend.

Best times and frequencies for North American reception are:

2130 GMT Saturdays (4:30 PM CDT), in their African service, on 17875, 17820, 15325, 15150, and 11945 kHz. (This is the only complete version; for some silly reason, other broadcasts have a minute or so cut out.

Midnite and 0300 GMT Mondays (that's Sunday at 7:00 PM CDT and 10:00 PM CDT) in the North American service -- several frequencies which I don't recall, but I always listen on 5960 kHz.

He'll even mention some ham nets if the topics discussed are of general interest. The whole program is of interest to anyone who has any interest at all in the world of shortwave.

Hauser has another program, too; his syndicated "WORLD OF RADIO" program is carried now on the new New Orleans shortwave station WRNO, at 2330 GMT Sundays (6:30 PM CDT Sunday) on 11855 kHz. This is a half-hour magazine show on all sorts of radio-oriented topics. Highly recommended.

Regards,
Will Martin (USArmy DARCOM ALMSA)

I tried to "Reply" to this message asking about Radio Venceremos, but
the system told me it didn't like the address AFTER I had typed the
text! (As someone who has been using ARPANET electronic mail for 6
years now, tI have troble accepting such system behavior with good
grace...it didn't even seem to save my text anywhere! Sloppy design...)

Anyway, here's the data:

Glenn Hauser's DX News segment on Radio Canada International's Shortwave
Listener's Digest reported the following recent data on Radio Venceremos:

Heard on two parallel frequencies varying over the ranges 6850-6853 kHz
and 6950-6953 kHz during the time range 0050-0249 GMT (one report was
for 0050-0149, and the other for 0249 alone).

Varying frequencies to avoid music jammers mainly on 6850 and 6955 kHz.

73's and good DX!

Will Martin

Hi!

I would like pointers to commercial sources (magazines, etc.) or,
ideally, an on-line file, of as complete as possible a list of ham
nets, the topics covered, the frequencies, and times.

I am assuming that some ham publications carry this as a feature
or department; the only one I regularly see is CQ, and I haven't seen

it in there.

Thanks much.

Recently, my father-in-law passed away. There is no one in the family with a ham license. He was always very interested in education, and teaching young people, so our ideal would be to donate his equipment to a group such as a high school radio club. Any other appropriate ideas would be appreciated. Although I don't have an exact inventory now, in general the equipment is 15-20 years old, tube stuff, in good operating condition when last used. I believe it is capable of 10 to 80 meter operation, and has a Heath SSB adapter rated at 1KW. Receiver is a DX-?. If you know of a good and interested recipient, I'm on 312-979-7305 from 8-4:45 CDT weekdays (after 7/12/82); or mail to ...!ihuxs!ljspot

Subject: Code Free license proposal -- W1AW bulletin

X-Google-Info: Converted from the original B-News header
Posted: Sun Jul 4 00:05:48 1982
Received: Sun Jul 4 01:41:09 1982

July 1, 1982 To all radio amateurs --
At its July 1 open meeting FCC has instructed its staff to draft a notice of proposed rulemaking dealing with a codeless amateur radio license. This NPRM will propose to simply remove the code requirement from the present Technician class license, with access limited to frequencies above 50 Mhz. The present Technician class license requiring code and permitting access to the Novice bands would also remain in force. However, the NPRM will also explore the possibility of a codeless digital license, similar to Canada's Digital Radio Operator Certificate, which requires knowledge of digital theory. Such a digital license could either be the only codeless license or it could be concurrent with a codeless Technician license. The NPRM will be released sometime this fall, and is a proposal only. There will be a comment period during which all interested parties will have a chance to make their views known to FCC.

To: All Packeteers
From: Hank Magnuski

I am about 95% through testing new versions of the LIP/TIP and KA6M/R software which does away with hardwired ID codes. The strategy is an expansion of the AMRAD suggestion to put the callsign at the front of each packet. Each packet will have a header of the following form:

    FLAG ADDR CTL FMCALL TOCALL ID0 ID1 Infofield FCS FLAG

Where

ADDR Assigned always to some fixed value. I'm using FE.
CTL All current values unchanged plus the addition of
Repeater connection reject packet
Station connection reject packet
Broadcast packet
FMCALL 7 bytes of callsign of the originator
TOCALL 7 bytes of callsign of the desination
ID0, ID1 Two bytes to indicate the protocol being used at the next
higher level, level 3.
Info Usual information field

The rules for operation are very simple:

A link-level packet going from A to B will have CALLA and CALLB
in the header, with no exceptions. This applies to the repeater
as well, which keeps a table of how to redirect packets.
All packets transmitted by the repeater have its call in the
FMCALL field.

I will have more details later, but I feel that this format solves most
of the problems which have been aired recently, and solves problems
which are currently restricting our growth. I'm open to midcourse
corrections, but they better come before we get all our EPROMs burned!
The strategy allows multiple repeaters on the same frequency in an RF
domain, it allows direct point-to-point contacts, and allows AMSAT to
use PHASE IIIB without any person coordinating the addressing codes.
I will put LIPM04.ASM and TIPM04.ASM on this medium when I feel they are
adequately tested.

See you when I get back from my vacation (July 12th).

73, Hank

qst de ad7i
hr propagation forecast bulletin nr 27 from arrl headquarters
newington ct july 7, 1982
to all radio amateurs bt

the month of june was remarkable for its extremes of solar activity. solar flux ranged from 256 on the 12th to 105 on the 30th. the sun

was almost spotless june 28 through july 4, and the solar flux
dropped to 103 july 1 and 2. it rose slowly thereafter, and it is
expected to continue with increased momentum after july 6.

sunspot numbers and the solar flux are not major factors during the
northern hemisphere summer. the state of the earths magnetic field
is more critical, as evidenced by good summer conditions as this
bulletin was issued. the wwv k index was 2 or lower over most of the
holiday period but erratic conditions can be expected during the
forecast week. disturbance peaks are due july 6 to 7 and 9 to 11.

american sunspot numbers june 24 through 30 were between 122 and 32
for a mean of 69. numbers in the low 30s were not reported in the
last five years until june 28. numbers will be higher next week ar

A M S A T

S A T E L L I T E R E P O R T

Number 37
12 July, 1982

Project OSCAR General Meeting

The Project OSCAR General Meeting will be held at the Electronic Museum, Foothill College, Los Altos, California, on 21 July, President John Pronko, W6XN, announced. The 2 hour meeting will begin at 1900 PDT and feature the annual business report and reports on current projects.

AMSAT to Take Part at ARRL Convention

AMSAT unveiled its plans for the AMSAT booth at this year's Annual ARRL Convention at Cedar Rapids, Iowa. The booth will be manned by expert OSCAR people. Hours for the exhibit are 23 July, 1800-2200; 24 July, 0800-1700; 25 July, 0800-1400. The AMSAT video tape will be displayed, along with K0RZ's Apple-based satellite information and tracking program, the ZX-81 project prototype, and of course handouts, tokens, and the like. Members who wish to help out the booth staff will have a chance to sign up at the booth.

The AMSAT seminar will be held from 0900 to 1200 on the 25th; it will consist of three one-hour parts. Included are OSCAR basics, a question and answer session, the tracking program, and a report on Phase IIIB.

Orbital Elements

The reason I no longer put the satellite orbital elements in this digest is that by the time it gets out, they will have changed a bit. For people who need or want these at frequent intervals, the Amateur Software Exchange CBBS keeps up to date elements. Again, the phone number for this service is 512-852-8194 (300 baud)

The AMSAT Satellite Report is a bi-weekly publication of the

Radio Amateur Satellite Corporation. Material may be quoted
without permission as long as credit is given. Material in
two single quotes (``*'') is taken directly from the bulletin,
while that in double quotes ("*") is an actual statement.

I just tried to deliver a piece of traffic that I picked up
on a local net tonight and was met on the other end of the phone
by an answering machine. While the message was playing, I was
debating whether or not to leave the traffic there and in the end
decided not to, since that would not give the receiving party much
of a chance to send a reply radiogram (though I could have left my
name and number). My question is: Is it OK to leave traffic on
an answering machine or did I do the right thing (I realize it is
a matter of personal habits, but I would like to know what the majority
of you think)?

Our radio club has some bucks to spend and we've decided to get a keyer.
We don't really need fancy features like memory or code practice
generation but are interested in a basic keyer.

If you use a keyer, I would appreciate your comments on it and would
like to know how much it costs.

Subject: Packet Nets
X-Google-Info: Converted from the original A-News header

     No doubt I am typical of alot of amateur ops. I received my
'ticket' in high school, and slowly fell away from amateur radio
during the 'college' years. Although I still get QST and all of the
related information, I very very rarely 'fire up' the rig.
     Interests now center around computer related things (!),
although I have been looking for a nice marriage of these two
topics. Oscar activities seemed like a possibility for awhile, however
nothing was ever done. More recently, I have been interested in
radio networks.
     It appears as if several packet switching amateur radio nets
are up and running now. I would like to ask those familar with them
to provide some information on their operation and functions.
Speaking for myself, there is nothing more I would like to do than
get my UNIX machines networked over an amateur radio path. Maybe
someone can comment on the legal aspects of such a system, in terms
of the amateur radio 'hobby' requirements.
     In any case, the creation of this news group is a very good
idea, I will be watching quite closely.

Well, to start something off concerning FCC actions and
things of that sort, a petition especially disturbing to
me was one submitted by Bill Welsh (W6DDB) This petition,
RM-3867 (info. on it appears in Worldradio, August, 1981,
p. 3.), proposes the reduction in General and Advanced
Class license privileges by some 20% each! i have written
to the FCC about it, and about my disapproval of it. However,
included in it is (in my opinion a good) proposal to give
the Novice licensees the 14.1 to 14.15 MHz subband. This
would allow them to experience even more kinds of propagation
and better our pool of public servants. I would like to hear
from anyone who has an opinion (either way) on this petition.

Subject: Any DXers?
X-Google-Info: Converted from the original A-News header

I too got interested in Amateur Radio in high school and while my level of activity fell off while I was in college, I still held some interest in it. After I graduated, living in an apartment didn't allow me to have much of a set-up. I dabbled in 2 meter FM and occasionally go over to a friend's house to operate the low bands. I'm looking foward to reading these news articles and hope to develop contacts with other hams through it. I used to do alot of DXing and would love to hear about how things are going in that field lately. Any big DXers out there?

Thanks for the support for net.ham-radio.
In addition to the net articles which you have seen,
several interested readers have sent mail to me supporting the idea.
The following is a first attempt at a call book of hams around the network.
When I have a reasonable number of additions, I will republish the list.
The mail addresses are referenced from a 'key' site in usenet.

Well, I got started a little over a year ago and found that 10
meters in the fall/winter (October to January/February) in the
mornings (10-12) was fantastic for Europe! Working my groundplane
last year, i could easily get ten countries in two hours every
Saturday and Sunday (not different ones all the time!) This
year, it should be almost as good (with the sunspot cycle just
beginning to decline), and with my new beam, i hope to do just
as well.

73,
Adam

X-Google-Info: Converted from the original A-News header

Here is just a little tidbit of information of what would
happen if RM-3867 is adopted without change: Future Advanced
Class licensees would have fewer privileges than present
Generals! This would constitue a 19.5% reduction in their
allocations, while the privileges of Generals would be
diminished by some 26%.

To: ihnss!houxf!kutsch
Subject: net.ham-radio

...

  Since Ham Radio went to a twice-monthly format, perhaps
net.ham-radio can fill the void of timely stuff. Let's hope the HR
gang and maybe the Worldradio staff are able to have access to this
net as both readers and contributers. Perhaps a telephone call or
letter to both might be in order. (I don't know the "politics" of
such a move.)

Subject: RE: packet radio uucp
X-Google-Info: Converted from the original A-News header

In response to Greg Ordy (WB8WWV) on packet radio (Oct 8):
Years ago while an undergraduate at West Virginia University
several of us who were hams and worked for the comp center thought
about two-way radio links for a terminal
(around the time the university first got started in time sharing).
At that time, ASCII was still considered a 'secret code' by the FCC and we
didn't feel like converting everything through baudot for transmission.
So the idea fell out of popularity.

However, with recent rules changes, this type of thing
becomes worth considering again.
Imagine several computer systems running their electronicc mail anmd uucp
via radio. I wonder what the national traffic system would think of that?

Subject: swap-n-shop legality issue
X-Google-Info: Converted from the original A-News header

The following discussion took place regarding the 'swap-n-shop' item in the
net.ham-radio announcement. Other opinions are welcome.

>From harpo!chico!duke!unc!lrn Thu Oct 8 19:17:35 1981
To: duke!chico!harpo!houxf!kutsch
Subject: net.ham-radio

This just to express interest in net.ham-radio. I have some question
whether you want to include the "shop" part of "swap-n-shop"
since that probably violates educational Unix licenses (though I'm
no lawyer).
         Lee (WA3IRQ)

>From kutsch Fri Oct 9 15:24:49 EDT 1981
TO: vax135!duke!unc!lrn
SUBJECT: re: net.ham-radio
Thanks for your interest Lee.
As far as swap-n-shop is concerned, I take the view of most
repeater operators. That is:
ham radio can be used to sstate that equipment is available or that a person
is looking for a particular item. However, discussions of price and
consumation of any deals MUST be done off-the-air.
I think this interpretation can be applied to swap-n-shop via net.ham-radio.
I (**PERSONALLY**) see no reason why one can't say that they want to get rid of
or find something. The net is merely bringing together two people with
similar interests.   They must then go to landline, US Mail, or an eye-ball
for further negotiation.

In response to cbosg!mark on 'packet radio net' (Oct 12) ...
The packet radio net he refers to is the 'aloha net' (sp?) which was later
refined into 'slotted aloha'. However, it is over commercial carrier, not
amateur radio service.

Some people believe that this early research laid the groundwork for the
'ether net' of Xerox PARC.
As Mark says, it has been in operation for several years linking terminals
and computers throughout the Hawaiian islands.

ARRL Official Bulletin #112
From: ARRL HQ, Newington, CT, October 7, 1981
To: All radio amateurs

Starting October 23, 1981 United States amateurs will no longer be
required to give the call sign of the station with which they are in contact
unless international third party traffic is being handled.
Furthermore, there will no longer be a requirement to identify your station
at the beginning of a transmission so long as you identify your station at
the end of the transmission or series of transmissions and at least once
each ten minutes during the communications.

...

The past president of our local radio club, Chip
Howard (N4AFU) was in an auto accident last august, suffered a spinal
injury, and is currently paralyzed from the shoulders on down.
...
Several of us are also working on a tone controlled switch
to select and activate various circuits (currently 2 meter rig + vox
control). If anyone has experience with problems of this sort, we
could certainly use the help. Particularly troublesome is the
development of signaling and timeout schemes that dont leave mikes open
etc.

73's Frank Starmer (KB4GZ)

[There is a group called 'handi-hams', supported by the ARRL and other
volunteers throughout the country, which collects circuits and educational
material for handicapped amateurs and other interested parties.
They sponsor classes, including a 2 week camp for soon-to-be hams; and even
have some equipment available at low cost or on loan.
Something more specific might be needed in this case,
so I am hoping other net readers might have more to offer.
More info on handi-hams is available from ARRL.   - Jim (WA8ZNH) houxf!kutsch]

Subject: legality of supervision
X-Google-Info: Converted from the original A-News header

At school, we want to set up a communications system
between the three major parts of our stage/lighting crew:
the lighting cage, the follow spot (up in the balcony),
and the curtain puller (across the stage from the cage).
The first thing we thought of was regular walkie talkies,
but that would cause too much static. Naturally, I thought
of 2 meters (in fact, one of the teachers said we would
need FM!) I know that people can operate while under the
supervision of a licensee. Would having me in the cage
constitute ``supervision'' over the other areas?

Subject: control
X-Google-Info: Converted from the original A-News header

Subject: control operator supervision
From: Frank Starmer (KB4GZ) [duke!cfs]

I do not believe that one can control multiple 'stations' without
some sort of direct control. Part 97 states that any third party
can participate provided that a control operator is present and
continuously monitors and supervises the radiocommunication to
insure compliance with the rules. For 2 meter repeater operation
this usually means ability to terminate a transmission (as in
autopatch operation) when the transmission is not in accordance
with good amateur practice. My guess would be that 'supervision'
is usually interpreted as the ability of the control operator
to control (either directly or indirectly) the operation of a
station either manually or by some remote facility that provides
the equivalent of manual control.

[May I be struck by lightning by what I'm about to say] Have you
considered using some of the low power (500 milliwatt) handitalkies
that operate in the !! 11 meter !! band? I believe they are cheap
and available through places like radio shaft.

Subject: Uosat telemetry info available
X-Google-Info: Converted from the original A-News header

I have written a C program that decodes Uosat-Oscar-9 telemetry.
If anyone is interested, I'd be happy to mail it.

I would like to maintain a list of recipients so that I can send
corrections and/or updates. If you get a copy of my program through
someone else, please let me know so I can send you updates. I'd also
like to know who is listening for Oscar-9 and how much interest there
is in it.

For those of you who haven't listened yet: The new Oscar is
audible on a 2-m HT using a rubber antenna! (Not inside buildings,
though). Listen on 145.825 Mhz, afternoons between 2pm and 4pm,
and you should hear the spacecraft.

Other items of interest to Uosat users:
1. I successfully copied 1200 baud ASCII telemetry last weekend.
Contrary to published specs, the spacecraft does NOT seem to invert
mark and space tones relative to the lower (<=300 baud speeds). A
standard Bell 202 modem works without modification both at 300 and
1200 baud.

2. The orbit of Uosat-Oscar-9 is so low that atmospheric drag is
causing significant errors in tracking. For example, last weekend,
I observed the spacecraft running as much as 1/2 hour earlier than
predicted by a set of NASA/NORAD elements obtained only 2 weeks ago.

I am receiving current orbital elements both through AMSAT and NASA, and will gladly send them to anyone who is interested. I can also mail copies of the BASIC program by Dr. Thomas Clark, W3IWI, Amsat President, that takes these elements and generates tracking information.

Phil Karn, KA9Q

Subject: ARRL Propagation Report
X-Google-Info: Converted from the original A-News header

QST de ad7i
HR Propagation Forecast Bulletin NR 44   from ARRL Headquarters
Newington CT November 1, 1981   (received at ad7i 11/2/81)
To all radio amateurs:

>From an October low of 174 on the 26th and 27th, the solar flux rose
to 210 by the 31st. The average for October was 212, the 19th
month over 200 in this solar cycle. As expected, geomagnetic
activity was lower in the final week of October, making for improved
propagation on 50 mhz and lower frequencies. All continents were
worked on 50 MHz from several U.S. and Canadian areas in this period.

November should also be very good for all DX activities, especially
on 28 and 50 MHz. The best days should come November 2 and 3, 9 and
10, 16 through 18 and in the final week of the month. Users of the
50 MHz band particularly should try to make optimum use of the next
few weeks as it seems unlikely that we will see anything like this
fall again for at least 9 or 10 years.

American sunspot numbers for October 22 through 28 were between 129
and 68 for a mean of 93.6. They should be higher in the next week.

Subject: Hussein donation to AMSAT
X-Google-Info: Converted from the original A-News header

>From the AMSAT net, 11/11/81 0200 UTC on 3850 Khz:

During the recent visit of King Hussein of Jordan (JY1) to the US,

he contacted Dr. Thomas Clark, W3IWI President, to give his support to the amateur radio satellite program. As a "small contribution" to aid the effort, he has donated the sum of $10,000 to AMSAT!

Rumor has it that while in Los Angeles, King Hussein visited Henry Radio, Inc, to purchase Oscar equipment for his station.

Subject: New Soviet Amateur Satellites
X-Google-Info: Converted from the original A-News header

Also from the 11/11/81 Amsat net:

Word from UA3CR is that launch of three new Soviet amateur radio satellites is "imminent". They have been completed and handed over to the Soviet military launch people. Subject to naming by their builders, AMSAT is referring to the three new spacecraft as RS-C, RS-D and RS-E. Each will carry a Mode-A type transponder, and uplink and downlink frequencies are as follows:

RS-C: 145.86-145.90 uplink, 29.36-29.40 downlink
RS-D: 145.91-145.95 uplink, 29.41-29.45 downlink
RS-E: 145.96-146.00 uplink, 29.46-29.50 downlink

There is also expected to be a "robot", an automatic QSO machine, on each of the three satellites. Uplink and downlink frequencies:
RS-C: 145.82 -> 29.32
RS-D: 145.83 -> 29.33
RS-E: 145.84 -> 29.34
The Robot will answer any call directed to it, e.g., "RS0 RS0 DE KA9Q KA9Q", and give a signal report! It is unclear how the spacecraft will deliver QSL cards, however.

Note also that the Robot uplinks on RS-C and RS-D are each 5 khz away from the Uosat-Oscar-9 general beacon. I wonder how long it will be before the Soviet satellites "work" Oscar-9....

Subject: bulletins, and how i get 'em.

Some folks have asked how i get the bulletins and place them onto the net. What follows is a run through of the sequence of events that i do to re-broadcast them via netnews.

I make it a habit to copy the arrl bulletins from w1aw almost every night at 6 pm EST on 40 meters. For this, i use my heath h89, running comm[]soft software, connected to the HAL ST-6 (it's old technology, but it sure works!) with the ears on 7095.0 KHz. During the broadcast i log all the data to disk, then following the broadcast i edit out all the stale bulletins and try to make any fills that might be needed (i rarely get them all). Next, i run the bulletins through a filter to convert everything to lower case. (The only reason for lower case is that i find it easier to read lower case than upper case; other than that, there's no special reason for lower case.)

The bulletins are then transferred to houxf and from there entered to the net. I don't alway get the bulletins the same day they are released, but a delay of more than 3 days should be unusual.

Because of work commitments, i will be at WECo Denver all of next week (NOV 16) and will be unable to send bulletins via the net, perhaps someone else could pick up the slack.

Paul, ad7i
